NovaSeq X Series Integration

The Illumina NovaSeq X Series integration provides preconfigured workflows that map to established lab protocols and steps used with NovaSeq X Series sequencing instruments. The integration also supports the associated library prep kits, reagent kits, and assays used in these protocols.

NovaSeq X Series Integration v1.2 Configuration and User Interaction

The Illumina NovaSeq X Series Integration Package v1.2 supports the integration of Clarity LIMS to Illumina NovaSeq X series instruments.

For instructions on validating and troubleshooting the Illumina NovaSeq X Series Integration, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

> The configuration provided in this integration has been established to support NovaSeq X Series lab processes. Any configuration changes to protocols or workflows (including renaming protocols, steps, and fields) could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq X Series Sequencing v1.1 workflow that maps to lab protocols and instrument runs.
- The following steps in the NovaSeq X Series Sequencing v1.1 preconfigured protocol:
  - Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)
  - Make Bulk Pool (NovaSeq X Series Sequencing v1.1)
  - Dilute and Denature (NovaSeq X Series Sequencing v1.1)
  - Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1)
  - AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1)
  - AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1)
- Automatic validation of run setup information before sample sheet generation or planned run creation.
- Automated generation of the sample sheet. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through Local run mode.
- Automated creation of a planned run on Illumina Connected Analytics (ICA). The NovaSeq X Series Control Software retrieves the planned run for use with the Cloud run mode.

For Research Use Only. Not for use in diagnostic procedures.

- Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics from BaseSpace Sequence Hub to Clarity LIMS.
- Automated tracking of the NovaSeq X Series analysis run and high level analysis summary from BaseSpace Sequence Hub to Clarity LIMS.
- Support for configuration of multiple secondary analyses with multiple library prep kits (LPKs) and index adapter kits (IAKs) for the planned run. The analysis is either performed by ICA in Cloud mode or by DRAGEN on-board the instrument in Local mode.
- [Optional] Preconfigured Library Prep Validation v2.3.2 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce libraries that are ready for the NovaSeq X Series Sequencing v1.1 workflow. For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.
- [Optional] Clarity LIMS Product Analytics (CLPA) integration that can be used with ICA. The CLPA integration installation and configuration is required. For more information, refer to *Clarity LIMS Product Analytics Integration v1.2 Configuration and User Interaction* on page 2399.

Prerequisites and Assumptions

The NovaSeq X Series Integration v1.2 requires a valid BaseSpace Sequence Hub account with an Enterprise or Professional subscription.

Analysis Configuration Template

The NovaSeq X Series Sequencing v1.1 workflow uses analysis configuration templates (ACTs) to configure secondary analysis for planned runs. Required ACTs must be created using BaseSpace Sequence Hub. The ACT names must be unique. The index adapter kit (the label group in Clarity LIMS) selected in the ACT is created in Clarity LIMS. The same label group must be used in the library preparation step. For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Make sure that ACT names created in BaseSpace Sequence Hub do not have leading or trailing spaces. Otherwise, Clarity LIMS can have issues with recognizing the ACT names.

Samples

Samples must go through the library preparation and quantification process before they enter the NovaSeq X Series Sequencing v1.1 workflow. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into Clarity LIMS.
- Samples have been run through QC and library prep.

- Samples have the Molarity (nM) global field set to a value. This value is required for the Calculate Volumes automation in the Make Bulk Pool step.

Sample and library names must use only alphanumeric, dash, or underscore characters.

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The NovaSeq X Series Integration Package v1.2 includes the following workflows:

- NovaSeq X Series Sequencing v1.1
- Library Prep Validation v2.3.2 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 1 NovaSeq X Series Integration Package v1.2 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
	Library Prep Validation v2.3.2 Workflow	
Library Prep Validation v2.3.2	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the NovaSeq X Series Sequencing v1.1 workflow. The label group (index adapter kit) used for library preparation must be the same as the index adapter kit specified in the ACT that is being used. For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32. The protocol contains a single step - Library Prep Validation v2.3.2. After this step, a routing script sends the samples to the first step of the NovaSeq X Series Sequencing v1.1 workflow (Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)).	1. Library Prep Validation v2.3.2
	NovaSeq X Series Sequencing v1.1 Workflow	

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq X Series Sequencing v1.1	This protocol models the lab processes of run setup for starting a NovaSeq X Series sequencing and secondary analysis run.	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) • The secondary analysis of samples is configured using the ACT. • The labels applied to the samples are validated against the selected ACT so that samples use valid labels. 2. Make Bulk Pool (NovaSeq X Series Sequencing v1.1) • The Calculate Volume script assists with pooling samples and adding resuspension buffers and reagents. • The Validate Analysis Configurations automation validates the ACT of pooled samples to make sure that the secondary analysis configurations remain valid after pooling. 3. Dilute and Denature (NovaSeq

Validation Workflow

The Library Prep Validation v2.3.2 workflow allows for validation of the system after installation is complete. This workflow can be replaced by other custom library preparation workflows. For details, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Configure a custom workflow as follows.

1. Select Configuration, then select Lab Work.
2. Add a Routing Script automation to the last Master Step of the library preparation workflow.
3. Select Configuration, then select Automation.
4. Create a new Routing Script automation and update it as follows.
   a. For Channel Name, enter limsserver.
   b. For Command Line, enter the following script:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0} script:changeWorkflow \
\
--FIELD_NAME 'Sequencing Instrument' \
--FIELD_VALUE 'NovaSeq X Series' \
--WORKFLOW 'NovaSeq X Series v1.1' \
--STEP 'Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

   c. For Automation Use, select the custom library preparation workflow.

Step Automations

The following table lists the step automations included in the NovaSeq X Series Sequencing v1.1 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Table 2 NovaSeq X Series Sequencing v1.1 Workflow Step Automations

Protocol	Step	Automation
NovaSeq X Series Sequencing v1.1	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)	• Register Step Completed[1] • Retrieve ACT Information • Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step • Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started[2]

For Research Use Only. Not for use in diagnostic procedures.

Protocol	Step	Automation
	2. Make Bulk Pool (NovaSeq X Series Sequencing v1.1)	• Calculate Volumes • Register Pools and Register Step Completed[1] • Register Step Started[1] • Set Next Step • Validate Analysis Configurations
	3. Dilute and Denature (NovaSeq X Series Sequencing v1.1)	• Calculate Volumes • Register Step Completed[1] • Set Next Step • Validate Inputs Flowcell Type and Register Step Started[2]
	4. Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1)	• Register Step Completed[1] • Set Next Step • Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started[2] • Validate Library Tube Strip Barcode • Validate Run Setup and Create Planned Run
	5. AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1)	• Register NovaSeq X RunCompleted and Register Step Completed[1] • Register Step Started and Register NovaSeq X Run and Register NovaSeq X Run Association and Register NovaSeq X RunStarted[1]
	6. AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1)	Not applicable

[1] These automations are required for CLPA support only.
[2] These automations are required for the NovaSeq X Series Sequencing v1.1 workflows and contain additional logic needed for CLPA support. If you would like to remove support for CLPA, contact Illumina Support.

All remaining automations are required for the NovaSeq X Series Sequencing v1.1 workflows.

The Illumina Universal Sample Identifier is a global field that is imported with the Library Prep Validation v2.3.2 and NovaSeq X Series Sequencing v1.1 workflows. Illumina Universal Sample Identifier is a text field that is reserved for CLPA support. The field is optional and not required for this integration.

For Research Use Only. Not for use in diagnostic procedures.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)

The Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) step uses ACTs to configure secondary analysis for samples. Each ACT contains details related to the secondary analysis (eg, index adapter kit to use, reference genome setting, and so on). You can select an ACT from a list and assign samples to it. A planned run can have multiple ACTs and this step must be repeated for each ACT that is required for the run. For more information on creating ACTs and assigning samples to them, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

The following automations are configured on this step:

- Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started
- Retrieve ACT Information
- Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step
- Register Step Completed

Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started Automation

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that submitted sample names contain only alphanumeric, dash, and underscore characters.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -exp 'submittedSamples.each { sample -> if (
!sample.name.matches( ::[A-Za-z0-9_-]+:: ) ) { fail ( ::Submitted sample :: +
sample.name + :: should only have alphanumeric, dash, and underscore characters.
Please rename and try again.:: ) } }' -log {compoundOutputFileLuid1}
```

- Retrieves the list of ACTs that were created in BaseSpace Sequence Hub.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:retrieve_act_list -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1}
```

- Registers the start time of the step by publishing messages to CLPA through the ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

For Research Use Only. Not for use in diagnostic procedures.

Retrieve ACT Information Automation

Automatically triggered when you select Retrieve ACT Information on the Record Details screen, this automation completes the following actions:

- Retrieves the details of the selected ACT and populates the step custom fields (eg, Analysis Version, Library Prep Kit, and so on).
- Saves the details into a file that is available to download. This file is stored in the Analysis Configuration Metadata file placeholder.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:retrieve_act_info -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration Template}'
```

Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Checks that the molarity of all samples is specified.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} script:evaluateDynamicExpression -t false -h false -exp 'if (!input.hasValue (::Molarity (nM)::)) { fail(::The Molarity cannot be empty.::) ; } else if (input.::Molarity (nM):: <= 0) { fail(::The Molarity cannot be negative or zero.::) ; }' -log {compoundOutputFileLuid1}
```

- Checks that all samples are indexed and for invalid indexes. The indexes applied are the same as the selected ACT.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:validate_indexes -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration Template}'
```

- Assigns the selected ACT to all samples in the step.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:assign_act -i {stepURI:v2} -u {username} -p {password} -a '{udf:Analysis Configuration Template}' -l {compoundOutputFileLuid1}
```

- Sets the next step for samples to ADVANCE, which advances them to the next step in the protocol (Make Bulk Pool (NovaSeq X Series Sequencing v1.1)).

```
nextStep = ::ADVANCE:
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table lists the configuration details for fields that are defined on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) step.

Table 3 Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) Master Step Field Configuration

Field Name	Field Type	Options
Analysis Configuration Template	Text Dropdown	Required Field
Application	Text	Read Only
Application Version	Text	Read Only
Index Adapter Kit	Text	Read Only
Library Prep Kit	Text	Read Only
Reference Genome	Text	Read Only
Secondary Analysis Mode	Text	Read Only

Global Fields

The following table lists the global custom fields that are configured to display on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) step.

Table 4 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Molarity (nM)	Numeric		Decimal places displayed = 2

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
ACT Name	Text	Read Only	

User Interaction

For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.1)

Samples are pooled in the Make Bulk Pool (NovaSeq X Series Sequencing v1.1) step. You can manually create working pools based on the final loading concentration required.

The following automations are configured on this step:

- Register Step Started
- Validate Analysis Configurations
- Calculate Volumes
- Set Next Step
- Register Pools & Register Step Completed

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step. This automation completes this action by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

Validate Analysis Configurations Automation

Automatically triggered on exit of the Pooling screen, this automation performs analysis configuration validity and checks each pool for the following characteristics:

- Pooled samples are within the maximum configuration limit.
- Pooled samples have the same type of analysis (eg, Cloud or Local).
- Pooled samples that have the same secondary analysis also have the same analysis version (eg, v3.8.4) and analysis settings (eg, Map/Align Output Format = CRAM).

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:validate_physical_logical_configurations -i {stepURI:v2}
-u {username} -p {password} -l {compoundOutputFileLuid1} -m PerPool
script:validate_analysis_config -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -m PerPool && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
script:validate_same_analyte_udf_value_for_all_inputs -i {stepURI:v2} -u
{username} -p {password} -l {compoundOutputFileLuid1} -f 'Run Mode' -perPool
true
```

Calculate Volumes Automation

Automatically triggered when you select Calculate Volumes on the Record Details screen, this automation completes the following actions:

- Proceeds if the sample has molarity values.

```
if (!input.hasValue(::Molarity (nM)::)) { return; };
```

- Uses Number of Samples in Pool to calculate the volumes needed for the 2 nM intermediate library pools.

```
if (output.hasValue(::Number of Samples in Pool::)) { output.::Number of Samples
in Pool:: = output.::Number of Samples in Pool:: + 1; } else { output.::Number
of Samples in Pool:: = 1; }' -t true
```

- Uses the Bulk Pool Volume (µl) field and Number of Lanes to Sequence (x100) to calculate volumes needed for the 2 nM intermediate library pools.
- Copies the Final Loading Concentration (pM) and Flowcell Type from the step inputs to the step outputs.

```
output.::Bulk Pool Volume (ul):: = 100 * step.::Number of Lanes to Sequence::;
output.::NovaSeq X Flowcell Type:: = step.::Flowcell Type::; output.::Final
Loading Concentration (pM):: = step.::Final Loading Concentration (pM)::;
```

- Calculates the per sample volume required for each library to make a 2 nM intermediate library pool and sets the total sample volume to zero.

```
input.::Per Sample Volume (ul):: = 2 * output.::Bulk Pool Volume (ul):: /
input.::Molarity (nM):: / output.::Number of Samples in Pool::;output.::Total
Sample Volume (ul):: = 0;' -t true
```

- Calculates the adjusted per sample volume for the pools.

```
script:calculate_multipool_adjusted_per_sample_volume -t
```

- Uses the Total Sample Volume (µl) to calculate the RSB volume (µl) required to top up the pools that are needed to create the 2 nM intermediate library pools. The RSB volume is saved to the file in the Calculation File placeholder in the Files section.

```
script:evaluateDynamicExpression \
-exp 'if (output.hasValue(::Total Sample Volume (ul)::)) { output.::Total Sample Volume (ul):: = output.::Total Sample Volume (ul):: + input.::Adjusted Per Sample Volume (ul)::; } else { output.::Total Sample Volume (ul):: = input.::Adjusted Per Sample Volume (ul)::; }' -t true \
script:evaluateDynamicExpression \
-exp 'if (output.::Total Sample Volume (ul):: > output.::Bulk Pool Volume (ul)::) { output.::RSB Volume (ul):: = 0 } else { output.::RSB Volume (ul):: = output.::Bulk Pool Volume (ul):: - output.::Total Sample Volume (ul):: }' -t true \
```

- Uses the `NovaSeqXSeries_Bulk_Pool1.csv` and `NovaSeqXSeries_Bulk_Pool2.csv` template files to generate a single CSV file. This file contains information about the pools and the samples that they contain. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_Pool1.csv -o 1.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_Pool2.csv -o 2.csv \
&& cat 1.csv 2.csv > {compoundOutputFileLuid0}.csv \
```

- Resets the Number of Samples in Pool, Total Sample Volume (µl), and Bulk Pool Volume (µl) to null before exiting the step.

```
-exp 'output.::Number of Samples in Pool:: = ::::; output.::Total Sample Volume (ul):: = ::::; output.::Bulk Pool Volume (ul):: = ::::;' -t true
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Proceeds only if the sample has a molarity value.
- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, which advances them to the Dilute and Denature (NovaSeq X Series Sequencing v1.1) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -log {compoundOutputFileLuid1} \
```

```
script:evaluateDynamicExpression -exp 'if (!input.hasValue(::Molarity (nM)::)){
return; }; output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::;'"
```

Register Pools & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the pool and library information used by the Clarity LIMS workflow. Samples in the pool are assumed to have gone through library preparation.
- Registers the completion time of the step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -
jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation completes this action by publishing messages to CLPA through ICA.

Master Step Fields

The following table lists configuration details for the fields that are defined on the Make Bulk Pool (NovaSeq X Series Sequencing v1.1) step.

Table 5 Make Bulk Pool (NovaSeq X Series Sequencing v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Dropdown Items • 90 • 140 • 150 • 160 • 180 Range from 0 Decimal places displayed: 0
Flowcell Type	Text	Required Field	Dropdown Items • 1.5B • 10B • 25B

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed: 2 Default • 2
Number of Lanes to Sequence	Numeric	Required Field	Range: 1–10 Decimal places displayed: 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool (NovaSeq X Series Sequencing v1.1) step.

Table 6 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed: 0 Dropdown Items • 225 • 400
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed: 2
NovaSeq X Flowcell Type	Text Dropdown	Required Field Read Only	Dropdown Items • 1.5B • 10B • 25B

User Interaction

For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.1)

The Dilute and Denature (NovaSeq X Series Sequencing v1.1) step allows you to dilute pooled samples with the addition of RSB.

The following automations are configured on this step:

- Validate Inputs Flowcell Type and Register Step Started
- Calculate Volumes
- Set Next Step
- Register Step Completed

Validate Inputs Flowcell Type and Register Step Started

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the specified flow cell type is valid.

  This script is required for the NovaSeq X Series Sequencing v1.1 workflow to function properly.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -h false -exp 'if (!input.hasValue(::NovaSeq X
Flowcell Type::)){fail(::Invalid Flowcell Type custom field value. Please make
sure all input samples have a value assigned for Flowcell Type custom
field.::)}' -log {compoundOutputFileLuid1}
```

- Registers the start time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

Calculate Volumes Automation

Automatically triggered when you select Calculate Volumes on the Record Details screen, this automation completes the following actions based on the NovaSeq X Flowcell Type selected:

- Sets the NaOH Volume (µl) and TT2 Volume (µl) field values.
- Computes the BP Aliquot Volume (µl) and RSB Volume (µl) required for the dilution of pools to the required final loading concentration.
- Sets the PhiX Volume (µl) and PhiX Concentration (µl) if there is a PhiX spike-in.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -
log {compoundOutputFileLuid1} \
script:evaluateDynamicExpression \
-exp '
if (input.::NovaSeq X Flowcell Type:: == ::10B:: || input.::NovaSeq X Flowcell
Type:: == ::1.5B::) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
output.::NaOH Volume (ul):: = 8.5;
output.::TT2 Volume (ul):: = 127.5;
output.::BP Aliquot Volume (ul):: = input.::Final Loading Concentration (pM):: *
170 / (2 * 1000);
output.::RSB Volume (ul):: = 34 - output.::BP Aliquot Volume (ul)::;
if (step.::1-2% PhiX Spike-In::) { output.::PhiX Volume (ul):: = 1;
output.::PhiX Concentration (pM):: = 300; }
else { output.::PhiX Volume (ul):: = ::::; output.::PhiX Concentration (pM):: =
::::; };
} else {
output.::NaOH Volume (ul):: = 14;
output.::TT2 Volume (ul):: = 210;
output.::BP Aliquot Volume (ul):: = input.::Final Loading Concentration (pM):: *
280 / (2 * 1000);
output.::RSB Volume (ul):: = 56 - output.::BP Aliquot Volume (ul)::;
if (step.::1-2% PhiX Spike-In::) { output.::PhiX Volume (ul):: = 1.6;
output.::PhiX Concentration (pM):: = 300; }
else { output.::PhiX Volume (ul):: = ::::; output.::PhiX Concentration (pM):: =
::::; };
}'
```

- Generates a single CSV file that contains information about the reagents volume required to dilute the working pools. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Dilute_
Denature_Calculate_Volumes.csv -o {compoundOutputFileLuid0}.csv -q true -
destLIMSID {compoundOutputFileLuid0} -l {compoundOutputFileLuid1} \
&& echo; echo 'Calculate Volumes completed successfully.'"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step.

For Research Use Only. Not for use in diagnostic procedures.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'output.::Run Mode:: =
input.::Run Mode::; nextStep = ::ADVANCE::' -log {compoundOutputFileLuid1}
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq X Series Sequencing v1.1) step.

Table 7 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
TT2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1)

The Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step allows you to scan the library tube strip barcode into Clarity LIMS. Then, you can place the working pools into the library tube strip used in the NovaSeq X Series run. This step also does the following actions:

- Validates the run setup and analysis information.
- Generates the sample sheet file.
- Creates a planned run on ICA, depending on the selected run mode.

The following automations are configured on this step:

- Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started
- Validate Library Tube Strip Barcode
- Validate Run Setup and Create Planned Run
- Set Next Step
- Register Step Completed

Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started Automation

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the selected destination container types on the Load to Library Tube Strip step matches the selected flow cell type of the samples. The 1.5B flow cell is compatible with the library 2-tube strip and the 10B and 25B flow cells are compatible with the library 8-tube strip.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} \
script:validate_same_udf_value_for_analytes -f 'Run Mode' -f 'NovaSeq X Flowcell
Type' \
script:validate_selected_container \
-fn 'NovaSeq X Flowcell Type' -fv '1.5B' -ct 'Library 2-tube Strip' \
-fn 'NovaSeq X Flowcell Type' -fv '10B' -ct 'Library 8-tube Strip' \
-fn 'NovaSeq X Flowcell Type' -fv '25B' -ct 'Library 8-tube Strip'
```

- Performs basic checks on the secondary analysis configuration of the samples in the same planned run. The following checks are included in this script:
  - Secondary analysis configuration of samples in a planned run is within maximum configuration limit.
  - Samples in a planned run have the same type of analysis (eg, Cloud or Local).
  - Samples in the same pools that have the same secondary analysis (eg, Illumina DRAGEN Enrichment) also have the same analysis settings (eg, Map/Align Output Format = CRAM) and the same analysis version (eg, v3.8.4).

    This script is required for the NovaSeq X Series Sequencing v1.1 workflow to function properly.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -m PerRun script:validate_analysis_config script:validate_physical_logical_configurations
```

- Registers the start time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

Validate Library Tube Strip Barcode Automation

Automatically triggered on the Placement screen, this automation validates the library tube strip barcode to make sure that it conforms to the barcode mask LC[0-9]{7}-LC1 for the library 8-tube strip and LC[0-9]{7}-L[A-Z]2 for the library 2-tube strip.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} script:validate_output_containers -l {compoundOutputFileLuid1} -r 'Library 8-tube Strip:LC[0-9]{7}-L[A-Z]1' -r 'Library 2-tube Strip:LC[0-9]{7}-L[A-Z]2' -max 1
```

Validate Run Setup and Create Planned Run Automation

Automatically triggered after a selection on the Record Details screen, this automation completes the following actions:

- Validates the parameters entered on the Record Details screen. These parameters are used to set up the run, generate the sample sheet file, and create the planned run in ICA, depending on the run mode.
  - Run Name can only contain alphanumeric, dash, underscore, or period characters. Do not use spaces.

```
if (!step.::Run Name::.matches(::[a-zA-Z0-9-_]+[a-zA-Z0-9-_. ]*::)) { fail(::Run Name contains prohibited characters. Please check to make sure Run Name only contains alphanumeric characters, spaces, dashes and underscores. Run Name must start with alphanumeric, a dash or an underscore::); }
```

  - Run Name cannot exceed 255 characters.

```
if (step.::Run Name::.length() > 255) { fail(::Run Name shall not exceed 255 characters.::); };
```

- Checks the Index 1 Cycles and Index 2 Cycles field values. If Index 2 Cycles is greater than 0, the Index 1 Cycles value must be greater than 0 or an error can occur.

```
if (step.::Index 2 Cycles:: > 0 && step.::Index 1 Cycles:: == 0) { fail(::Index
1 Cycles cannot be zero if Index 2 Cycles is non-zero::); };
```

- Generates the sample sheet and creates the planned run in ICA. The sample sheet is attached to the step.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:generate_sample_sheet -i {stepURI:v2} -u {username} -p
{password} -c {compoundOutputFileLuid0} -l {compoundOutputFileLuid1}
```

There is a backend validation of the sample sheet content in ICA. This validation makes sure that the sample sheet is valid to set up a Local mode run and that it is ready for use with DRAGEN applications.

For more information on sample name character restrictions, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step.

```
output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table shows the master step fields that are configured on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step. These fields are required for sample sheet generation and planned run creation in ICA.

Table 8 Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Cloud Run ID	Text	Read Only	Hidden Used for creating a planned run in ICA. Do not remove, rename, or modify this field as it can cause the integration to break.
Index 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Index 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Presets • 51 • 101 • 151
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Presets • 51 • 101 • 151
Run Mode	Text Dropdown	Required Field	Presets • Local • Cloud
Run Name	Text	Required Field	

User Interaction

For more information, refer to *NovaSeq X Series Integration v1.2 Validation and Troubleshooting* on page 32.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1)

The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step is fully automated. The integration starts the step, adds samples to the Ice Bucket, and completes the step. Data from the run is parsed back to Clarity LIMS. In this step, pooled samples in the library tube strip are sequenced on the NovaSeq X Series instrument.

> Do not add samples to the Ice Bucket or start and complete the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step. The integration does this automatically.

The following automations are configured on this step:

- Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted
- Register NovaSeq X RunCompleted & Register Step Completed

Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted Automation

Automatically triggered at the beginning of the step, this automation completes the following actions:

- Registers the start time of the step.
- Registers the NovaSeq X Series sequencing run configuration.
- Registers the association of the sequencing run with the samples by linking the Instrument Run ID with the sample ID.
- Registers the time that the sequencing run started.

This automation completes these actions by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/register_novaseqxseries_run.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_associate_seqrun.groovy'
```

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_started.groovy'
```

Register NovaSeq X RunCompleted & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the sequencing run completion time, run status, and run metrics. This script requires the Cloud Run ID custom field from the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step.
- Registers the completion time of the step.

This automation completes these actions by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_completed.groovy'
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following tables show the master step fields that are configured on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step.

Table 9 Clarity LIMS Master Step Field Information

Field Name	Source File	Corresponding Field in Source File	Additional Information
Current Cycle	`RunCompletionStatus.xml`	CompletedReads	Visible on Record Details screen. Calculated based on the CompletedReads field.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Current Read	`RunCompletionStatus.xml` `RunParameters.xml`	CompletedReads PlannedReads	Visible on Record Details screen. Calculated based on the CompletedReads field in `RunCompletionStatus.xml` and PlannedReads field in `RunParameters.xml`.
Flow Cell Expiration Date	`RunParameters.xml`	ExpirationDate	Visible on Record Details screen. Corresponds to the value in the ExpirationDate field under the ConsumableInfo field for FlowCell Type.
Flow Cell ID	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value in the SerialNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Lot Number	`RunParameters.xml`	LotNumber	Visible on Record Details screen. Corresponds to the value in the LotNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Part Number	`RunParameters.xml`	PartNumber	Visible on Record Details screen. Corresponds to the value of the PartNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Side	`RunParameters.xml`	Side	Visible on Record Details screen.
Flow Cell Type	`RunParameters.xml`	FlowCellType	Visible on Record Details screen.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Instrument Control Software Version	`RunParameters.xml`	SystemSuiteVersion	Visible on Record Details screen.
Instrument ID	`RunParameters.xml`	InstrumentSerialNumber	Visible on Record Details screen.
Instrument Type	`RunParameters.xml`	InstrumentType	Visible on Record Details screen.
Output Folder	`RunParameters.xml`	OutputFolder	Visible on Record Details screen.
Library Tube Strip Barcode	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value of the SerialNumber field under the ConsumableInfo field for SampleTube Type.
Library Tube Lot Number	`RunParameters.xml`	LotNumber	Hidden Do not remove, rename, or modify this field as it can cause the integration to break. Corresponds to the value of the LotNumber field under the ConsumableInfo field for SampleTube Type.
Run End Time	`RunCompletionStatus.xml`	RunEndTime	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Name	`RunParameters.xml`	ExperimentName	Visible on Record Details screen.
RTA Version	Not used	Not used	Hidden

For Research Use Only. Not for use in diagnostic procedures.

Table 10 Other Clarity LIMS Master Step Fields

Field Name	Value	Additional Information
Run Status	Presets • RunStarted • RunCompletedSuccessfully • RunAbortedByUser • RunErroredOut Set by the SIS integration service.	Visible on Record Details screen.
Sequencing Log	Set by the SIS integration service during the sequencing run.	Visible on Record Details screen.
BaseSpace Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
ICA Project ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Instrument Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Start Time	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.

Global Fields

The following global custom fields are used to capture the run metrics in Clarity LIMS:

- % Bases >=Q30 R1
- % Bases >=Q30 R2

- % Error Rate R1
- % Error Rate R2
- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2
- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % PrePhasing R1
- % PrePhasing R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

At the end of the step, the pools of samples are automatically removed from the step. The step completes automatically when Run Status is RunCompletedSuccessfully.

Step 6: AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1)

The AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) step is fully automated. The integration starts and completes the step automatically. Data from the analysis is parsed back to Clarity LIMS. In this step, the secondary analysis configured using the ACT is performed in ICA. There are no automations associated with this step.

Do not add samples to the Ice Bucket or start and complete the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step. The integration does this automatically.

Master Step Fields

The following tables show the master step fields that are configured on the AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) step.

Do not modify the names of the master step fields. Modifications cause the integration to break.

Table 11 AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) Master Step Field Information

Field Name	Source File	Additional Information
Analysis Status	Presets • Started • Completed • Failed • NeedsAttention • Stopped • TimedOut • CompletedWithErrors Set by the SIS integration service.	Visible on Record Details screen.
Analysis Result Location	Received from the SQS message in the SIS integration service.	Visible on Record Details screen.
Library Tube Strip Barcode	Identified by the SIS integration service using information from `RunParameters.xml`.	Hidden

How the Integration Works

The following information summarizes how the NovaSeq X Series integration works.

- After the Validate Run Setup and Create Planned Run automation is triggered on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step, the run parameters entered in the Run Details screen are sent to ICA. The analysis configuration parameters from the selected ACTs are also sent to ICA. ICA validates the run and analysis configuration. If the validation fails, ICA sends an error message to Clarity LIMS. If the validation passes, ICA generates the sample sheet and sends it back to Clarity LIMS. ICA also creates the planned run based on the selected run mode (eg, Local or Cloud).
  - For the Local run mode, the sample sheet is generated and stored in Clarity LIMS. This sample sheet contains the run and analysis configuration information required to start the run on the NovaSeq X Series instrument.
  - For the Cloud run mode, the planned run is created in ICA. The planned run contains the run and analysis configuration information required to start the run on the instrument. The sample sheet is generated and stored in Clarity LIMS for reference purposes.
- When the sequencing run starts on the instrument, the NovaSeq X Series Control Software notifies BaseSpace Sequence Hub. BaseSpace Sequence Hub monitors the run and uses the Stratus Integration Service (SIS) to notify Clarity LIMS. The events are processed and the integration

For Research Use Only. Not for use in diagnostic procedures.

service retrieves the run information from BaseSpace Sequence Hub. This information is used to populate the custom fields in the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step.

- Other run events follow the same information flow. When sequencing is complete, the control software uploads the sequencing run data (primary metrics) and associated files to ICA. Then, Clarity LIMS retrieves the primary metrics and uses them to populate the fields in the Sample Details table (eg, % Error Rate R1). The custom fields (eg, Run Status, Current Read, and so on) on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step are updated using the run related information. If the sequencing run is successfully completed, the step automatically completes.
- The integration tracks the analysis events and results in the AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) step. You must log in to BaseSpace Sequence Hub to retrieve the cloud analysis results. For local analysis, the secondary analysis results are in the external storage configured in Illumina Run Manager. The external storage information is found in the External Storage for Analysis Results configuration settings in Illumina Run Manager.
- If a planned run with the same sample name and project name (case-insensitive) has been created previously in ICA, the sample sheet generated from the Validate Run Setup and Create Planned Run automation can reflect the original case of the previous sample name. This can cause validation errors for analysis configurations with sample-level settings. To resolve this issue, change the sample name or the project name on Clarity LIMS and run the automation again.

Start a Sequencing Run on NovaSeq X Series Instrument

The following sections outline the steps to start a Clarity LIMS cloud or local run on the NovaSeq X Series instrument.

Run Mode Configuration

1. In the NovaSeq X Series Control Software, log in to the instrument using an account that has permissions for configuring settings.
2. On the menu, select Settings, then select Cloud settings.
3. In Run Settings, select the Cloud run storage checkbox.
4. For Hosting location, select the applicable location from the drop-down options.
5. [Optional] For Private domain name, enter the domain name according to the workgroup that was configured with the NovaSeq X Series integration package.
6. Select Save.

Start a Sequencing Run in Local Run or Cloud Run Modes

Start a Sequencing Run in Local Run Mode

1. Log in with the BaseSpace Sequence Hub account and select the workgroup used during the NovaSeq X Series integration package installation.
2. Import the sample sheet created in the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step. Refer to information on creating a local run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.
3. When the sample sheet is selected, the contents are validated. After the validation passes, select Next.
4. Select Save As Planned.
   Run and analysis data is parsed and auto-populates in the list of runs. For more information on planning a NovaSeq X Series run, refer to the Plan a NovaSeq X Series Run section of the BaseSpace Sequence Hub Online Help at help.basespace.illumina.com and the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.
5. Start the run. Refer to information on starting a planned run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.

Start a Sequencing Run in Cloud Run Mode

To start a sequencing run in cloud run mode, refer to information on starting a planned run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Reagent Kits

- Buffer Cartridge
- Lyophilization Cartridge
- NaOH
- Reagent Cartridge
- Resuspension Buffer (RSB)
- TT2

Container Types

- Library 2-Tube Strip
- Library 8-Tube Strip
- Tube

This integration supports the library 8-tube strip with the barcode in the LC[0-9]{7}-L[A-Z]1 format. The integration also supports the library 2-tube strip with the barcode in the LC[0-9]{7}-L[A-Z]2 format.

Control Types

- PhiX v3

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- All submitted samples must have an associated secondary analysis that is configured using the analysis configuration template (ACT). The ACT must be configured on BaseSpace Sequence Hub before starting the Assign Analysis Configuration Template step. The ACT names must be unique.
- The library tube strip barcode must be unique. There must not be multiple library tube strip containers with the same name in the system.
- Reagent labels, or indexes, must be unique.
- One library pool can only contain one library or control with no label/index.
- The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) and AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) steps must not be manually started or completed. These steps are fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, you must select Validate Run Setup and Create Planned Run in the Load to Library Tube step.

NovaSeq X Series Integration v1.2 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq X Series Integration Package v1.2.

The validation process involves the following actions:

- Running samples through the Library Prep Validation v2.3.2 workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce libraries tagged with index sequences. At the end of the step, these libraries are routed to NovaSeq X Series Sequencing v1.1 workflow.
- Running libraries through the NovaSeq X Series Sequencing v1.1 workflow validates the following items:
  - Successful sequential step advancement of samples through the steps of the workflow.

- Automatic validation of run setup information before sample sheet generation or planned run creation.
- Automated sample sheet generation. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through the Local run mode.
- Automated creation of a planned run in Illumina Connected Analytics (ICA). The control software retrieves the planned run. The run is started through the Cloud run mode.
- Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics from BaseSpace Sequence Hub to Clarity LIMS.
- Automated tracking of the NovaSeq X Series analysis run and high level analysis summary from BaseSpace Sequence Hub to Clarity LIMS.

The validation steps assume that the following conditions have been met:

- The NovaSeq X Series Integration v1.2 has a valid BaseSpace Sequence Hub account with an Enterprise or Professional subscription.
- NovaSeq X Series Integration Package v1.2 is installed and you have imported the default Clarity LIMS configuration.
- Analysis configuration templates (ACTs) are created in BaseSpace Sequence Hub (BaseSpace Sequence Hub) for your run. Make sure that the index adapter kit label group is created in Clarity LIMS before selecting it in the ACT. This same label group is used in the Run Library Prep Validation v2.3.2 step. For more information on creating a reagent label group, refer to *Add and Configure Labels and Label Groups* in the Clarity LIMS Core Documentation. For the adapter sequences for your library prep kits, refer to *Illumina Adapter Sequences*.

Analysis Configuration Template Creation in BaseSpace Sequence Hub

You must create the Analysis Configuration Templates (ACTs) that are required for configuring secondary analysis in the NovaSeq X Series Sequencing v1.1 workflows. Create and delete ACTs in BaseSpace Sequence Hub. For instructions, refer to the *BaseSpace Sequence Hub Online Help* on the Illumina support site.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v2.3.2 and NovaSeq X Series Sequencing v1.1 workflows.

Sample and library names must use only alphanumeric, dash, or underscore characters. Invalid characters can cause a sample sheet validation failure in the Load to Library Tube Strip step.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.3.2 and NovaSeq X Series Sequencing v1.1 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.2

This single-step protocol models the library prep required to produce libraries tagged with index sequences that are ready for the NovaSeq X Series Sequencing v1.1 workflow.

Run Library Prep Validation v2.3.2

1. In Lab View, locate the Library Prep Validation v2.3.2 protocol.
   Samples are queued for the Library Prep Validation v2.3.2 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, under Label Options, select the label groups that you want to use.
   The label group, or index adapter kit, selected must be the same as the Index Adapter Kit selected in the ACT that is being used.

   TruSeq HT Adapters v2 (D7-D5) is the default label group in the Library Prep Validation v2.3.2. For other reagent labels, you can manually create them. For more information, refer to *Add and Configure Labels and Label Groups* in the *Clarity LIMS Core Functionality* documentation.

   The adapter sequences from Illumina library prep kits, refer to Illumina Adapter Sequences.
4. Select Begin Work.
5. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
6. On the Add Labels screen, the Labels to Add list contains labels from the label group selected in 3.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
7. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.

      The Molarity (nM) values are used in the Calculate Volume automation script in the Make Bulk Pool (NovaSeq X Series Sequencing v1.1) step. If these values are not entered, the automation script does not work properly.

   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq X Series.
   c. Populate the fields in the Sequencing Instrument column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.

For Research Use Only. Not for use in diagnostic procedures.

- To populate all fields at one time, copy and paste from a spreadsheet.
- Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument, and then select NovaSeq X Series from the adjacent drop-down list. Select Apply.

If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
c. In the spreadsheet, enter the Molarity (nM) and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.
d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

8. Select Next Steps.
   This selection triggers the Set Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq X Series Sequencing v1.1 workflow, Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1).

Protocol: NovaSeq X Series Sequencing v1.1

The NovaSeq X Series Sequencing v1.1 protocol consists of the following steps:

- Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)
- Make Bulk Pool (NovaSeq X Series Sequencing v1.1)
- Dilute and Denature (NovaSeq X Series Sequencing v1.1)
- Load To Library Tube Strip (NovaSeq X Series Sequencing v1.1)
- AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1)
- AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1)

Each step contains a script to register the start time (upon step entry) and the time that the step is completed (upon step exit). This information is published to CLPA through the ICA LINK service. These scripts are used only for CLPA support and can be incorporated as part of an automation that performs other functions.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.1 protocol. The samples are queued for the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work to start the Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started automation.
   The automation checks that the sample names do not use restricted characters and are within character limits and retrieves the list of ACTs that you can select. The automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The part of the script for start time registration is used only for CLPA support.
4. Select the applicable ACT to assign to the samples. The index adapter kit specified by the ACT must correspond with the label group used in *Library Prep Protocol: Library Prep Validation v2.3.2* on page 34.
5. [Optional] In Step Details, select Retrieve ACT Information to trigger the Retrieve ACT Information automation.
   This automation retrieves ACT information (eg, Library Prep Kit, Index Adapter Kit, Reference Genome, and so on) and populates the fields in Clarity LIMS. These details are saved to the `ACTMetadata.csv` file that you can download. If you are not sure of the analysis configuration before starting the sequencing and analysis run, refer to the details in the file.
6. Select Next Steps to assign the ACT to the samples.
   This action triggers the Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step automation. This automation validates that the indexes applied to the libraries are valid for the selected ACT and assigns samples to it. All samples added to the Ice Bucket in 2 are assigned to this ACT.
7. Select Finish Step.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.1)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.1 protocol. The samples are queued for the Make Bulk Pool (NovaSeq X Series Sequencing v1.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
   You can also add control samples by selecting them from the Available control samples drop-down list and selecting Add.
3. On the Ice Bucket screen, select Begin Work.
4. Create a pool of samples as follows.
   a. On the Pooling screen, create a pool by dragging samples into the Pool Creator.
      If a control sample was added, it appears under the Sample List and can be pulled into the pool that needs the control.

For Research Use Only. Not for use in diagnostic procedures.

b. Enter a name for your pool or accept the default name (Pool #1).

c. [Optional] If multiple pools are required, select the plus sign (+) next to Pool Creator to create a pool.

d. [Optional] To remove a pool, select the X in the top right corner of the pool.

e. Select Record Details to trigger the Validate Analysis Configurations automation.
This automation performs the following checks on the analysis configuration for each pool:

- Pooled samples are within the maximum configuration limit.
- Pooled samples have the sample type of analysis (Cloud or Local).
- Pooled samples that have the same secondary analysis also have the same analysis version and settings.

5. On the Record Details screen, navigate to the Reagent Lot Tracking section to track the lot information used in the step.
6. [Optional] Create a new lot. For more information, refer to *Add and Configure Reagent Kits and Lots* in the Clarity LIMS LIMS Core Functionality documentation.
7. In the Step Details area, complete the following required fields:
   - Number of Lanes to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced. This field is applied to all pools in the step.
   - Final Loading Concentration (pM)—The final loading concentration of the pool in the flow cell.
   - Minimum Per Sample Volume (µl)—The minimum volume for each sample. This field is prepopulated with the configured default value (2 µl) and can be edited. If the per sample volume is below the value set in this field, the Calculate Volumes script applies a rounding factor to affected samples so that the volume reaches the minimum volume.
   - Flowcell Type—The flow cell type that the run uses. This selection affects the computation of volumes in the Calculate Volumes automation that generates the calculation file. Select from the following options:
     - 1.5B
     - 10B
     - 25B
8. Select Calculate Volumes to trigger the Calculate Volumes automation.
   This automation calculates the volumes required for each library to form a pool that has the concentration and volume specified in the Step Details field. It also generates the calculation file in a CSV format and attaches it to the step. Select the file name to download it.
9. In the Sample Details table, select the pool next to the sample name to view details on the pool composition.
10. Select Next Steps to trigger the Set Next Step automation.

This automation sets the next step for samples to ADVANCE, which moves them to the Dilute and Denature (NovaSeq X Series Sequencing v1.1) step.

11. Select Finish Step.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.1)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.1 protocol. The pool of samples queued for the Dilute and Denature (NovaSeq X Series Sequencing v1.1) displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the library tube strip) and select Begin Work.
   - On entry to the step, the Validate Inputs Flowcell Type and Register Step Started automation is triggered. This automation makes sure that the configured flow cell type is valid. The automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The portion of the script used for start time registration is used only for CLPA support.
   - If PhiX is used for the run, navigate to the Record Details screen and set 1–2% PhiX Spike-In to Yes. Select Calculate Volumes to trigger the Calculate Volume automation. This automation sets the following values:
     - BP Aliquot Volume (µl)
     - RSB Volume (µl)
     - NaOH Volume (µl)
     - TT2 Volume (µl)
     - PhiX Volume (µl) and Concentration (pM) (if there is a PhiX spike-in)
     - The automation also generates the calculation file (CSV) and attaches it to the step. This file contains information about the volume of RSB, NaOH, and TT2 to add per working pool. If there is a PhiX spike-in, the file also contains information on the PhiX volume and concentration.
4. On the Record Details screen, the Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and TT2 reagents used in the step. To add and activate reagent lots, refer to *Add and Configure Reagent Kits and Lots* in the Clarity LIMS LIMS Core Functionality documentation.
5. On the Record Details screen, perform the following actions:
   a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   b. In the Sample Details table, make sure that the BP aliquot, RSB, NaOH, and TT2 reagent volume values are populated. The script sets these values and they cannot be edited.
   c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.

6. In the Files area, select the Calculation File (CSV) to open it and view details on the volumes for each reagent and sample pool used for the dilute and denature process.
7. Select Next Steps.
   On the Assign Next Step screen, the next step is already set to Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1).
8. Select Finish Step.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.1 protocol. The pool of samples are queued for the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step.
2. Add the pools to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select one of the following destination container types:
   - Library 8-tube Strip
   - Library 2-tube Strip
4. Select Begin Work to trigger the Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started automations.
   - The Validate Flowcell Inputs automation ensures that the correct container is selected for the flow cell type and that the number of inputs is the same as the number of available wells on the library tube strip. The Validate Analysis Configurations automation is similar to the automation used in the Make Bulk Pool step.
   - The Register Step Started automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The portion of the script used for start time registration is used only for CLPA support.
5. To use multiple ACTs in a single run, repeat steps 1–4 for each ACT.
   The pool of samples for each ACT is then queued for the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) step to be added to the Ice Bucket.
6. On the Placement screen, do as follows.
   a. Drag the pools into the Placed Samples area on the right.
   b. Scan or type the barcode of the library tube strip into the container name field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Strip Tube Barcode automation makes sure that the library tube strip barcode conforms to the barcode mask. For the Library 8-tube Strip, the barcode mask is LC[0-9]{7}-L[A-Z]{1}1 and an error message displays if the barcode does not match. For the Library 2-tube Strip, the barcode mask is LC[0-9]{7}-L[A-Z]{1}2.
7. The fields displayed on the Record Details screen are used to create the planned run and generate the sample sheet.
   The analysis related information for the planned run is from the ACT associated with the samples and no further analysis configuration is required. Refer to the following table for details.

For Research Use Only. Not for use in diagnostic procedures.

Table 12 Fields Displayed on Record Details Screen of Load to Library Tube Strip (NovaSeq X Series Sequencing v1.1) Step

Field	Value
Run Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
Run Mode	The selected Run Mode must correspond to the ACT type. Presets • Local[1] • Cloud[2]
Read 1 Cycles	Presets • 151 • 101 • 51 • Type a custom value
Read 2 Cycles	Presets • 151 • 101 • 51 • Type a custom value
Index 1 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]
Index 2 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]

[1] The Local run mode generates the sample sheet. The Run/Analysis configuration is imported manually to the NovaSeq X Series instrument through the sample sheet. The sample sheet is downloaded and imported manually by the user on NovaSeq X Control Software to start the run. The downstream secondary analysis is done using the onboard DRAGEN module.
[2] The Cloud run mode sends the Run/Analysis configuration to ICA. This configuration is downloaded to the NovaSeq X Series instrument through ICA to start the run. The downstream secondary analysis is done in the cloud.
[3] The custom value must correspond to the longest index sequence of the samples in the pools in the library tube strip. Otherwise, the planned run creation fails and an error message displays.

8. Select Validate Run Setup and Create Planned Run to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

- Creates the planned run and sends it to ICA when the Run Mode is Cloud.
- Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen for all Run Mode types.

9. Select Next Steps.
   On the Assign Next Steps screen, the next step for the pooled samples is set to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step.
10. Select Finish Step to advance the pooled samples to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step. For more information on how to start the sequencing run for different run modes, refer to *NovaSeq X Series Integration v1.2 Configuration and User Interaction on page 1*.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1)

This protocol contains the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step. This step is fully automated.

Do not add samples to the Ice Bucket or start or complete the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step. The integration does this automatically.

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics in the Step Details section and the Sample Details table.

Step Details Section

The following values populate the master step fields:

- Run Name
- Run Status
- Output Folder
- Current Read
- Current Cycle
- Library Tube Barcode
- Flow Cell ID
- Flow Cell Side
- Flow Cell Type
- Flow Cell Part Number

- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Sequencing Log

Sample Details Table

Summary metrics populate the following global custom fields:

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2
- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

Step 6: AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1)

This protocol contains the AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) step. This step is fully automated.

Do not add samples to the Ice Bucket or start or complete the AUTOMATED - Analysis Run (NovaSeq X Series Sequencing v1.1) step. The integration does this automatically.

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS. If the run analysis is successful, the integration completes the step automatically.

Review Analysis Data

After the analysis run is complete, open the step and review the following values in the Step Details section:

- Analysis Status
- Analysis Result Location
- Log

After the analysis is complete, download the demultiplexing results and analysis results summary files from the file placeholders. Retrieve detailed analysis results from ICA.

The demultiplexing results file contains the following demultiplexing statistics for each sample:

- Number of reads
- Number of perfect index reads
- Number of mismatch index reads

The analysis result summary file provides a summary of what analysis workflows were performed. This file also identifies the total number of samples analyzed and how many were completed or failed for each analysis.

At this point, the entire NovaSeq X Series Integration workflow is fully validated.

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the *Troubleshooting Automation* section in the Clarity LIMS API & Database documentation.

Automated Step Does Not Start

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step does not start, Clarity LIMS is likely not receiving sequencing run events from BaseSpace Sequence Hub correctly. Check for the following issues:

1. Make sure that the NovaSeq X Control Software is configured properly as follows.
    a. Before you start the run, in the NovaSeq X Control Software, select the appropriate BaseSpace Sequence Hub region in the Hosting location drop-down list.
    b. Under Run Settings, check the boxes next to Cloud run monitoring and Cloud run storage.

If there are issues after using the configuration settings on the NovaSeq X Control Software, contact Illumina Support.

Automated Step Starts, But Does Not Complete

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.1) step starts, but does not complete, do as follows.

1. Log in to the default user account and use one of the following methods to open the in progress step in Clarity LIMS:
   a. In Lab View, find the step in the Recent Activities pane.
   b. Search for the step in Clarity LIMS using the library tube strip barcode as the search term.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Error When Creating Planned Runs

If you receive an error when creating a planned run, check the log message in the Load to Library Tube Strip step to identify the issue. If you cannot correct the issue, contact Illumina Support.

Incompatible Analyses in a Planned Run

Only compatible analysis versions should be combined in a single planned run. When incompatible analysis versions are combined, an error log message displays. To resolve this error, check the ACTs that were used for the run and only select the ACTs that are compatible with the planned run.

Validate Analysis Configuration Automation Check Fails

The Validate Analysis Configuration automation check is in the Make Bulk Pool (upon pooling) and Load to Library Tube Strip (upon step entry) steps. If a failure happens, an error message displays and the step can be aborted, or you might be prevented from continuing the step. For NovaSeq X Series Integration v1.2, the configuration limits for the Cloud and Local modes are as follows.

- Cloud—Maximum of seven applications and genome configurations (and, if needed, the BCL Convert Only application). Cloud mode also allows up to eight different library prep kits for each application and genome configuration.
- Local—Maximum of three applications and genome configurations (and, if needed, the BCL Convert Only application). Local mode also allows up to eight different library prep kits for each application and genome configuration.

This check can fail for the following reasons:

- The analysis configuration after library pooling or during the planned run creation exceeds the configuration limit. Resolve this error as follows.

  - If the error occurs on the Make Bulk Pool step, reduce the number of analysis configurations for a pool. To reduce the number, reorganize the samples for the pooling step (eg, by pooling samples that have similar configurations together).
  - If the error occurs on the Load to Library Tube step, reduce the number of analysis configurations for the planned run by reorganizing the samples for multiple runs instead of a single run.
- ACTs of samples in the same pool or planned run must have the same run mode (Local or Cloud). Resolve this error as follows.
  1. Abort the step and remove samples with ACTs that have conflicting run modes from the Ice Bucket.
  2. Make sure that all remaining samples in the Ice Bucket have ACTs with the same run modes.
  3. Select Begin Work to continue the step.
- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis version. Resolve this error as follows.
  - If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different pools.
  - If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different runs.
- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis settings. The analysis setting fields can differ for a different secondary analysis and are configured in BaseSpace Sequence Hub when the ACT is created. Resolve this error as follows.
  1. If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different pools.
  2. If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different runs.

NovaSeq X Series Integration v1.2 Manual Upgrade

NovaSeq X Series Integration Package v1.2 includes modifications to the existing NovaSeq X Series Sequencing workflows to support the following new features:

- PhiX control included in the Dilute and Denature step instead of the Make Bulk Pool step.
- Support for the new 1.5B and 25B flow cells.
- Analysis tracking for the status and high level analysis result summary through the AUTOMATED - Analysis Run step (this is done at the metaworkflow level).

> Analysis tracking is a new step in NovaSeq X Series protocol and cannot be added to a non-pending protocol or workflow. For analysis tracking at the metaworkflow level, do not proceed with the manual upgrade. Instead, install the NovaSeq X Series v1.2 Integration Package with the NovaSeq X Series Sequencing v1.1 protocol.

- The following workflow updates are included in NovaSeq X Series Integration Package v1.2:
  - AUTOMATED - Sequencing Run step: Renamed the Library Tube Barcode master step custom field. This field is now named Library Tube Strip Barcode.
  - Load to Library Tube Strip step: Removed the Output Folder master step custom field.
  - Make Bulk Pool master step: Updated the dropdown items in the Final Loading Concentration (pM) custom field.

Use the following instructions to manually update the workflows.

Prerequisites

Illumina recommends upgrading to Illumina Preset Protocols (IPP) v2.7 to support the new features. If you do not have IPP v2.7 installed, do the following before starting the manual upgrade:

- Install `ClarityLIMS-NGS-Package-v5 RPM` v5.24.
- Replace the following files in `/opt/gls/clarity/extensions/conf/driverfiletemplates`:
  - `NovaSeqXSeries_Bulk_Pool1.csv`
  - `NovaSeqXSeries_Bulk_Pool2.csv`
  - `NovaSeqXSeries_Dilute_Denature_Calculate_Volumes.csv`

For copies of the replacement files, contact Illumina Support.

Add New Containers

1. On the Configuration tab, select Consumables, and then select Containers.
2. Add the following information to enable the Library 2-tube Strip container that supports the 1.5B flow cell:

   > No action is required for the 25B flow cell. The flow cell uses the same Library 8-tube Strip as the 10B flow cell.

   a. For Container Name, enter Library 2-tube Strip.
   b. For Rows, update the following fields:
      - Number: 2
      - Naming: Alphabetic
   c. For Columns, update the following fields:
      - Number: 1

- Naming: Numeric
- Start at: 1

Add New Master Step Fields

Enable PhiX control in the Dilute and Denature step as follows.

1. On the Configuration tab, select Custom Fields, and then select Master Step Fields.
2. Add the following master step fields for the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step:

Table 13 Dilute and Denature (NovaSeq X Series Sequencing v1.x) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
PhiX Volume (µl)	Numeric	Read Only	Decimal places displayed: 1
1–2% PhiX Spike-In	Toggle Switch	Required Field	Default • No

Modify Existing Master Step Fields

1. On the Configuration tab, select Custom Fields, and then select Master Step Fields.
2. Modify the following master step fields:

Table 14 Master Step Field Modifications

Master Step	Field	Modification	Purpose/Notes
Make Bulk Pool (NovaSeq X Series Sequencing v1.x)	Final Loading Concentration (pM)	1. Update Dropdown Items with the following options: • 90 • 140 • 150 • 160 • 180	• Only perform this modification if the new Dropdown Items are required. • This modification is not required to enable support for the new flow cells or PhiX control in the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step.
	Flowcell Type	1. Change Field Type from Text to Text Dropdown. 2. Update Field Options as follows. • Read Only: = No • Custom Entries = No 3. Update Dropdown Items with the following options: • 1.5B • 10B • 25B	This modification is required to support the new flow cells.

For Research Use Only. Not for use in diagnostic procedures.

Master Step	Field	Modification	Purpose/Notes
Load to Library Tube Strip (NovaSeq X Series Sequencing v1.x)	Output Folder	1. Remove the field.	• If the step has been run previously and this field is used, it cannot be removed. This field does not affect the functionality of the workflow. • This modification is not required to enable support for the new flow cells or PhiX control in the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step.

Master Step	Field	Modification	Purpose/Notes
AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.x)	Library Tube Barcode	1. Rename the field from Library Tube Barcode to Library Tube Strip Barcode.	• If the installed NovaSeq X Series workflow is v1.1 or earlier, this modification is not required to enable support for the new flow cells or PhiX control in the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step. • For NovaSeq X Series workflow v1.2, this modification is required. Run event handling fails without this modification.

Modify Existing Global Field

1. On the Configuration tab, select Custom Fields, and then select Global Fields.
2. For the NovaSeq X Flowcell Type field, update the Dropdown Items with the following values:

   A merge conflict is expected when upgrading from IPP v2.6 to v2.7 due to the changes in the NovaSeq X Flowcell Type field.

   - 1.5B
   - 10B
   - 25B

Add, Configure, and Modify Automations

Add Automation

1. On the Configuration tab, select Automation, and then select Step Automation.

2. On the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.x) step, add the following automation to enable new flow cell types:
   - Name—Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started
   - Channel Name—limsserver
   - Command line:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} \
script:validate_same_udf_value_for_analytes -f 'Run Mode' -f 'NovaSeq X Flowcell
Type' \
script:validate_selected_container \
-fn 'NovaSeq X Flowcell Type' -fv '1.5B' -ct 'Library 2-tube Strip' \
-fn 'NovaSeq X Flowcell Type' -fv '10B' -ct 'Library 8-tube Strip' \
-fn 'NovaSeq X Flowcell Type' -fv '25B' -ct 'Library 8-tube Strip' && \
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -m PerRun script:validate_analysis_config
script:validate_physical_logical_configurations && \
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'"
```

Configure Automation Settings

1. On the Configuration tab, select Lab Work.
2. Configure the trigger location and style for the following automations:

Table 15 Automation Configuration

Step	Automation	Setting	Purpose/Notes
Load to Library Tube Strip (NovaSeq X Series Sequencing v1.x)	Validate Flowcell Inputs and Validate Analysis Configurations and Register Step Started	• Trigger Location: Step • Trigger Style: Automatic upon entry	These configuration updates are required to enable the new flow cell types.
	Validate Input Count and Validate Analysis Configurations and Register Step Started	Trigger Location: Not used	

For Research Use Only. Not for use in diagnostic procedures.

Step	Automation	Setting	Purpose/Notes
Dilute and Denature (NovaSeq X Series Sequencing v1.x)	Calculate Volumes	• Trigger Location: Record Details • Trigger Style: Manual button	This configuration update is required to enable PhiX control on the Make Bulk Pool (NovaSeq X Series Sequencing v1.x) step.

Modify Step Automations

1. On the Configuration tab, select Automation, and then select Step Automation.
2. Select the Calculate Volumes automation that is enabled on the Make Bulk Pool (NovaSeq X Series Sequencing v1.x) step.
3. Update the existing command line as follows.
   This modification is required to move the PhiX control from the Make Bulk Pool (NovaSeq X Series Sequencing v1.x) step to the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step. Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -
log {compoundOutputFileLuid1} \
script:evaluateDynamicExpression \
-exp 'if (!input.hasValue(::Molarity (nM)::)) { return; }; if (output.hasValue
(::Number of Samples in Pool::)) { output.::Number of Samples in Pool:: =
output.::Number of Samples in Pool:: + 1; } else { output.::Number of Samples in

&& echo; echo 'Calculate Volumes completed successfully.'"
```

6. Select the Set Next Step automation that is enabled on the Dilute and Denature (NovaSeq X Series Sequencing v1.x) step.
7. Update the existing command line as follows.
   This modification is required to enable support for the 1.5B and 25B flow cells and future 8-tube library strips. Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'output.::Run Mode:: =
input.::Run Mode::; output.::NovaSeq X Flowcell Type:: = input.::NovaSeq X
Flowcell Type::; nextStep = ::ADVANCE::' -log {compoundOutputFileLuid1}"
```

8. Select the Validate Library Tube Strip Barcode automation that is enabled on the Load to Library Tube Strip Barcode (NovaSeq X Series Sequencing v1.x) step.
9. Update the existing command line as follows.
   This modification is required to enable support for the 1.5B and 25B flow cells and future 8-tube library strips. Changes are highlighted in red.

For Research Use Only. Not for use in diagnostic procedures.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:validate_output_containers -l {compoundOutputFileLuid1} -r 'Library 8-
tube Strip:LC[0-9]{7}-L[A-Z]{1}1' -r 'Library 2-tube Strip:LC[0-9]{7}-L[A-Z]
{1}2' -max 1"
```

Modify Existing Steps

Enable PhiX Control

1. On the Configuration tab, select Lab Work.
2. Select the Make Bulk Pool (NovaSeq X Series Sequencing v1.x) step.
3. For Control Types, remove PhiX v3.
4. For the Record Details milestone, navigate to Step Data and remove the following fields:
   - Final Loading Volume (µl)
   - % PhiX (2.0 nM) Spike-In
5. Select the Dilute and Denature (NovaSeq X Series v1.x) step.
6. Select the Record Details milestone.
7. Navigate to Step Data and add 1-2% PhiX Spike-In to Master Step Fields.

Enable New Flow Cell Types

1. On the Configuration tab, select Lab Work.
2. Select the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.x) step.
3. Select the Queue milestone.
4. Navigate to Sample Table and add the NovaSeqX Flowcell Type field to Column Headers.
5. Select the Ice Bucket milestone.
6. Navigate to Sample Table and add the NovaSeqX Flowcell Type field to Column Headers.
7. Select the Placement milestone.
8. Navigate to Destination Containers and add Library 2-tube Strip.

NovaSeq X Series Integration v1.2 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeq X Series Integration Package v1.2.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v6.2 and later (with a BaseSpace Sequence Hub account that has the Enterprise or Professional subscription)
- NGS Extensions Package v5.24 and later

- Illumina Preset Protocols (IPP) v2.7.0 and later
- NovaSeq X Series Control Software v1.2.0

New Features

- Supports analysis tracking at the metaworkflow level for analysis status and high level analysis summary results.
- Supports the new 1.5B and 25B flow cell types. The B3 flow cell has been renamed to the 10B flow cell.
- Uses the SecureString type for improving the security of values stored in the AWS param store.
- Includes the following improvements to the NovaSeq X Series Sequencing v1.1 protocol:
  - Removes the unused Output Folder step custom field from the Load to Library Tube Strip step.
  - Renames the Library Tube barcode step custom field to Library Tube Strip Barcode in the AUTOMATED - Sequencing Run step.

Defects Fixed

- None

Known Limitations

- You must log in to BaseSpace Sequence Hub to retrieve the cloud analysis results. For local analysis, the secondary analysis results are located in the external storage configured in Illumina Run Manager. The analysis step tracks only the first run, but not subsequent queued runs.
- The Local run mode does not support custom library prep and index adapter kits.

Known Issues

- On the Make Bulk Pool step, the log displays a warning when the Calculate Volume automation is triggered and at least one pool consists of multiple inputs. This issue is caused by the output custom field being reset multiple times at the end of the automation. This issue does not affect the volume calculation.
- On the Dilute and Denature step, the BP Aliquot Volume value is rounded up to the nearest µl. The value in the calculation file is reflected with up to two decimal places.
- All leading and trailing spaces are removed from the ACT names and ACTs created in BaseSpace Sequence Hub. Names containing leading or trailing spaces may not be recognized by Clarity LIMS. Make sure that ACTs created in BaseSpace Sequence Hub do not have leading or trailing spaces.

NovaSeq X Series Integration v1.1 Configuration and User Interaction

The Illumina NovaSeq X Series Integration Package v1.1 supports the integration of Clarity LIMS to Illumina NovaSeq X series instruments.

For instructions on validating and troubleshooting the Illumina NovaSeq X Series Integration, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

The configuration provided in this integration has been established to support NovaSeq X Series lab processes. Any configuration changes to protocols or workflows (including renaming protocols, steps, and fields) could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq X Series Sequencing v1.0 workflow that maps to lab protocols and instrument runs.
- The following steps in the NovaSeq X Series Sequencing v1.0 preconfigured protocol:
  - Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)
  - Make Bulk Pool (NovaSeq X Series Sequencing v1.0)
  - Dilute and Denature (NovaSeq X Series Sequencing v1.0)
  - Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)
  - AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)
- Automatic validation of run setup information before sample sheet generation or planned run creation.
- Automated generation of the sample sheet. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through Local run mode.
- Automated creation of a planned run on Illumina Connected Analytics (ICA). The NovaSeq X Series Control Software retrieves the planned run for use with the Cloud run mode.
- Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics into Clarity LIMS.
- Support for configuration of multiple secondary analyses with multiple library prep kits (LPKs) and index adapter kits (IAKs) for the planned run. The analysis is either performed by ICA in Cloud mode or by DRAGEN on-board the instrument in Local mode.
- [Optional] Preconfigured Library Prep Validation v2.3.1 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce libraries that are ready for the NovaSeq X Series Sequencing v1.0 workflow. For more information, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.
- [Optional] Clarity LIMS Product Analytics (CLPA) integration that can be used with ICA. The CLPA integration installation and configuration is required. For more information, refer to *Clarity LIMS Product Analytics Integration v1.2 Configuration and User Interaction* on page 2399.

Prerequisites and Assumptions

Analysis Configuration Template

The NovaSeq X Series Sequencing v1.0 workflow uses analysis configuration templates (ACTs) to configure secondary analysis for planned runs. Required ACTs must be created using BaseSpace Sequence Hub. The ACT names must be unique. The index adapter kit (the label group in Clarity LIMS) selected in the ACT is created in Clarity LIMS. The same label group must be used in the library preparation step. For more information, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Make sure that ACT names created in BaseSpace Sequence Hub do not have leading or trailing spaces. Otherwise, Clarity LIMS can have issues with recognizing the ACT names.

Samples

Samples must go through the library preparation and quantification process before they enter the NovaSeq X Series Sequencing v1.0 workflow. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have the Molarity (nM) global field set to a value. This value is required for the Calculate Volumes automation in the Make Bulk Pool step.

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The NovaSeq X Series Integration Package v1.1 includes the following workflows:

- NovaSeq X Series Sequencing v1.0
- Library Prep Validation v2.3.1 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 16 NovaSeq X Series Integration Package v1.1 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.1 Workflow		

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.1	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the NovaSeq X Series Sequencing v1.0 workflow. The protocol contains a single step - Library Prep Validation v2.3.1. After this step, a routing script sends the samples to the first step of the NovaSeq X Series Sequencing v1.0 workflow (Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)).	1. Library Prep Validation v2.3.1

NovaSeq X Series Sequencing v1.0 Workflow

For Research Use Only. Not for use in diagnostic procedures.

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq X Series Sequencing v1.0	This protocol models the lab processes of run setup for starting a NovaSeq X Series sequencing run.	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) • The secondary analysis of samples is configured using the ACT. • The labels applied to the samples are validated against the selected ACT so that samples use valid labels. 2. Make Bulk Pool (NovaSeq X Series Sequencing v1.0) • The Calculate Volumes script assists with pooling samples and adding resuspension buffers and reagents. • The Validate Analysis Configurations automation validates the ACT of pooled samples to make sure that the secondary analysis configurations remain valid after pooling. 3. Dilute and Denature (NovaSeq

For Research Use Only. Not for use in diagnostic procedures.

Validation Workflow

The Library Prep Validation v2.3.1 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Step Automations

The following table lists the step automations included in the NovaSeq X Series Sequencing v1.0 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Table 17 NovaSeq X Series Sequencing v1.0 Workflow Step Automations

Protocol	Step	Automation
NovaSeq X Series Sequencing v1.0	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)	Register Step Completed[1] Retrieve ACT Information Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started[2]
	2. Make Bulk Pool (NovaSeq X Series Sequencing v1.0)	Calculate Volumes Register Pools and Register Step Completed[1] Register Step Started[1] Set Next Step Validate Analysis Configurations
	3. Dilute and Denature (NovaSeq X Series Sequencing v1.0)	Calculate Volumes Register Step Completed[1] Set Next Step Validate Inputs Flowcell Type and Register Step Started[2]
	4. Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)	Register Step Completed[1] Set Next Step Validate Analysis Configurations and Register Step Started[2] Validate Library Tube Strip Barcode Validate Run Setup and Create Planned Run
	5. AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)	Register NovaSeq X RunCompleted and Register Step Completed[1] Register Step Started and Register NovaSeq X Run and Register NovaSeq X Run Association and Register NovaSeq X RunStarted[1]

[1] These automations are required for CLPA support only.

[2] These automations are required for the NovaSeq X Series Sequencing v1.0 workflows and contain additional logic needed for CLPA support. If you would like to remove support for CLPA, contact Illumina Support.

All remaining automations are required for the NovaSeq X Series Sequencing v1.0 workflows.

The Illumina Universal Sample Identifier is a global field that is imported with the Library Prep Validation v2.3.1 and NovaSeq X Series Sequencing v1.0 workflows. Illumina Universal Sample Identifier is a text field that is reserved for CLPA support. The field is optional and not required for this integration.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)

The Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step uses ACTs to configure secondary analysis for samples. Each ACT contains details related to the secondary analysis (eg, index adapter kit to use, reference genome setting, and so on). You can select an ACT from a list and assign samples to it. A planned run can have multiple ACTs and this step must be repeated for each ACT that is required for the run. For more information on creating ACTs and assigning samples to them, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

The following automations are configured on this step:

- Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started
- Retrieve ACT Information
- Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step
- Register Step Completed

Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started Automation

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that submitted sample names contain only alphanumeric, dash, and underscore characters.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -exp 'submittedSamples.each { sample -> if (
!sample.name.matches( ::[A-Za-z0-9_-]+:: ) ) { fail ( ::Submitted sample :: +
sample.name + :: should only have alphanumeric, dash, and underscore characters.
Please rename and try again.:: ) } }' -log {compoundOutputFileLuid1}
```

- Retrieves the list of ACTs that were created in BaseSpace Sequence Hub.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:retrieve_act_list -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1}
```

- Registers the start time of the step by publishing messages to CLPA through the ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

Retrieve ACT Information Automation

Automatically triggered when you select Retrieve ACT Information on the Record Details screen, this automation completes the following actions:

- Retrieves the details of the selected ACT and populates the step custom fields (eg, Analysis Version, Library Prep Kit, and so on).
- Saves the details into a file that is available to download. This file is stored in the Analysis Configuration Metadata file placeholder.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:retrieve_act_info -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration
Template}'
```

Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Checks that the molarity of all samples is specified.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'if (!input.hasValue
(::Molarity (nM)::)) { fail(::The Molarity cannot be empty.::) ; } else if
(input.::Molarity (nM):: <= 0) { fail(::The Molarity cannot be negative or
zero.::) ; }' -log {compoundOutputFileLuid1}
```

- Checks that all samples are indexed and for invalid indexes. The indexes applied are the same as the selected ACT.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:validate_indexes -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration
Template}'
```

- Assigns the selected ACT to all samples in the step.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:assign_act -i {stepURI:v2} -u {username} -p {password} -a '{udf:Analysis Configuration Template}' -l {compoundOutputFileLuid1}
```

- Sets the next step for samples to ADVANCE, which advances them to the next step in the protocol (Make Bulk Pool (NovaSeq X Series Sequencing v1.0)).

```
nextStep = ::ADVANCE:
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table lists the configuration details for fields that are defined on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step.

Table 18 Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) Master Step Field Configuration

Field Name	Field Type	Options
Analysis Configuration Template	Text Dropdown	Required Field
Application	Text	Read Only
Application Version	Text	Read Only
Index Adapter Kit	Text	Read Only
Library Prep Kit	Text	Read Only
Reference Genome	Text	Read Only
Secondary Analysis Mode	Text	Read Only

Global Fields

The following table lists the global custom fields that are configured to display on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step.

Table 19 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Molarity (nM)	Numeric		Decimal places displayed = 2
ACT Name	Text	Read Only	

User Interaction

For more information, refer to the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.0)

Samples are pooled in the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step. You can manually create working pools based on the final loading concentration required.

The following automations are configured on this step:

- Register Step Started
- Validate Analysis Configurations
- Calculate Volumes
- Set Next Step
- Register Pools & Register Step Completed

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

Validate Analysis Configurations Automation

Automatically triggered on exit of the Pooling screen, this automation performs analysis configuration validity and checks each pool for the following characteristics:

- Pooled samples are within the maximum configuration limit.
- Pooled samples have the same type of analysis (eg, Cloud or Local).
- Pooled samples that have the same secondary analysis also have the same analysis version (eg, v3.8.4) and analysis settings (eg, Map/Align Output Format = CRAM).

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:validate_physical_logical_configurations -i {stepURI:v2}
-u {username} -p {password} -l {compoundOutputFileLuid1} -m PerPool
script:validate_analysis_config -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -m PerPool && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
script:validate_same_analyte_udf_value_for_all_inputs -i {stepURI:v2} -u
{username} -p {password} -l {compoundOutputFileLuid1} -f 'Run Mode' -perPool
true
```

Calculate Volumes Automation

Automatically triggered when you select Calculate Volumes on the Record Details screen, this automation completes the following actions:

- Proceeds if the sample has molarity values.

```
if (!input.hasValue(::Molarity (nM)::)) { return; };
```

- Uses Number of Samples in Pool to calculate the volumes needed for the 2 nM intermediate library pools.

```
if (output.hasValue(::Number of Samples in Pool::)) { output.::Number of Samples
in Pool:: = output.::Number of Samples in Pool:: + 1; } else { output.::Number
of Samples in Pool:: = 1; }' -t true
```

- Uses the Bulk Pool Volume (µl) field and Number of Lanes to Sequence (x100) for the B3 flow cell type to calculate volumes needed for the 2 nM intermediate library pools.
- Copies the Final Loading Concentration (pM) and Flowcell Type from the step inputs to the step outputs.

```
if (step.::Flowcell Type:: == ::B3::) { output.::Bulk Pool Volume (ul):: = 100 *
step.::Number of Lanes to Sequence::; }; output.::NovaSeq X Flowcell Type:: =
step.::Flowcell Type::; output.::Final Loading Concentration (pM):: =
step.::Final Loading Concentration (pM)::;
```

- Calculates the per sample volume required for each library to make a 2 nM intermediate library pool.

```
input.::Per Sample Volume (ul):: = 2 * output.::Bulk Pool Volume (ul):: /
input.::Molarity (nM):: / output.::Number of Samples in Pool::;
```

- If PhiX is used for a planned run (eg, a value for % PhiX (2.0 nM) Spike-In is specified), sets the PhiX Volume (µl).

```
if (step.hasValue(::% PhiX (2.0nM) Spike-In::)) { step.::PhiX Volume (ul):: =
step.::% PhiX (2.0nM) Spike-In:: / 100 * step.::Final Loading Volume (ul)::; };
```

- Calculates the adjusted per sample volume for the pools.

```
script:calculate_multipool_adjusted_per_sample_volume -t
```

- Uses the Total Sample Volume (µl) to calculate the RSB volume (µl) required to top up the pools that are needed to create the 2 nM intermediate library pools. The RSB volume is saved to the file in the Calculation File placeholder in the Files section.

```
script:evaluateDynamicExpression \
-exp 'if (output.hasValue(::Total Sample Volume (ul)::)) { output.::Total Sample
Volume (ul):: = output.::Total Sample Volume (ul):: + input.::Adjusted Per
Sample Volume (ul)::; } else { output.::Total Sample Volume (ul):: =
input.::Adjusted Per Sample Volume (ul)::; }' -t true \
script:evaluateDynamicExpression \
-exp 'if (output.::Total Sample Volume (ul):: > output.::Bulk Pool Volume
(ul)::) { output.::RSB Volume (ul):: = 0 } else { output.::RSB Volume (ul):: =
output.::Bulk Pool Volume (ul):: - output.::Total Sample Volume (ul):: }' -t
true \
```

- Uses the `NovaSeqXSeries_Bulk_Pool1.csv` and `NovaSeqXSeries_Bulk_Pool2.csv` template files to generate a single CSV file. This file contains information about the pools and the samples that they contain. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_
Pool1.csv -o 1.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_
Pool2.csv -o 2.csv \
&& cat 1.csv 2.csv > {compoundOutputFileLuid0}.csv \
```

- Resets the Number of Samples in Pool, Total Sample Volume (µl), and Bulk Pool Volume (µl) to null before exiting the step.

```
-exp 'output.::Number of Samples in Pool:: = ::::; output.::Total Sample Volume
(ul):: = ::::; output.::Bulk Pool Volume (ul):: = ::::;' -t true
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Proceeds only if the sample has a molarity value.
- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, which advances them to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -
log {compoundOutputFileLuid1} \
script:evaluateDynamicExpression -exp 'if (!input.hasValue(::Molarity (nM)::)){
return; }; output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::;'"
```

Register Pools & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the pool and library information used by the Clarity LIMS workflow. Samples in the pool are assumed to have gone through library prep.
- Registers completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -
jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table lists configuration details for the fields that are defined on the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.

Table 20 Make Bulk Pool (NovaSeq X Series Sequencing v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100

Field Name	Field Type	Options	Additional Options and Dropdown Items
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	
Final Loading Volume (µl)	Numeric	Required Field	Default • 200
Flowcell Type	Text	Required Field Read Only	Default • B3
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 2
Number of Lanes to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
PhiX Volume (µl)	Numeric	Read Only	Hidden Decimal places displayed = 1 Used for Calculate Volume script when there is PhiX spike-in. Do not remove, rename, or modify this field as it can cause the integration to break.

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.

Table 21 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			

Field Name	Field Type	Options	Additional Options and Dropdown Items
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed = 0 Presets • 225 • 400
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
NovaSeq X Flowcell Type	Text	Required Field Read Only	Default • B3

User Interaction

For more information, refer to Run Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.0)

The Dilute and Denature (NovaSeq X Series Sequencing v1.0) step allows you to dilute pooled samples with the addition of RSB.

The following automations are configured on this step:

- Validate Inputs Flowcell Type and Register Step Started
- Calculate Volumes
- Set Next Step
- Register Step Completed

Validate Inputs Flowcell Type and Register Step Started

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the specified flow cell type is valid.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -h false -exp 'if (!input.hasValue(::NovaSeq X
Flowcell Type::)){fail(::Invalid Flowcell Type custom field value. Please make
sure all input samples have a value assigned for Flowcell Type custom
field.::)}' -log {compoundOutputFileLuid1}
```

- Registers the start time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

Calculate Volumes Automation

Automatically triggered when you enter the Record Details screen, this automation completes the following actions:

- Checks that the NovaSeq X Flowcell Type is B3 and sets NaOH Volume (µl) and TT2 Volume (µl) field values to 10 and 150.
- Computes BP Aliquot Volume (µl) and RSB Volume (µl) required for the dilution of pools to the required final loading concentration.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -log {compoundOutputFileLuid1} \
script:evaluateDynamicExpression \
-exp 'if (input.::NovaSeq X Flowcell Type:: == ::B3::) { output.::NaOH Volume (ul):: = 10; output.::TT2 Volume (ul):: = 150; }; output.::BP Aliquot Volume (ul):: = input.::Final Loading Concentration (pM):: * 200 / (2 * 1000); output.::RSB Volume (ul):: = 40 - output.::BP Aliquot Volume (ul)::;'
```

- Generates a single CSV file that contains information about the reagents volume required to dilute the working pools. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p {password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Dilute_Denature_Calculate_Volumes.csv -o {compoundOutputFileLuid0}.csv -q true -destLIMSID {compoundOutputFileLuid0} -l {compoundOutputFileLuid1}"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'output.::Run Mode:: =
input.::Run Mode::; nextStep = ::ADVANCE::' -log {compoundOutputFileLuid1}
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.

Table 22 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
TT2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

For more information, refer to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)

The Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step allows you to scan the library tube strip barcode into Clarity LIMS. Then, you can place the working pools into the library tube strip used in the NovaSeq X Series run. This step also does the following actions:

- Validates the run setup and analysis information.
- Generates the sample sheet file.
- Creates a planned run on ICA, depending on the selected run mode.

The following automations are configured on this step:

- Validate Input Count and Validate Analysis Configurations and Register Step Started
- Validate Library Tube Strip Barcode
- Validate Run Setup and Create Planned Run
- Set Next Step
- Register Step Completed

Validate Input Count and Validate Analysis Configurations and Register Step Started

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the number of input pools is the same as the number of tubes in the library tube strip.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:validateSampleCount -min 8 -max 8
```

- Performs basic checks on the secondary analysis configuration of the samples in the same planned run. The following checks are included in this script:
  - Secondary analysis configuration of samples in a planned run is within maximum configuration limit.
  - Samples in a planned run have the same type of analysis (eg, Cloud or Local).
  - Samples in the same pools that have the same secondary analysis (eg, Illumina DRAGEN Enrichment) also have the same analysis settings (eg, Map/Align Output Format = CRAM) and the same analysis version (eg, v3.8.4).

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxser
ies-automation.jar script:validate_physical_logical_configurations -i
{stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -m
PerRun script:validate_analysis_config -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -m PerRun &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar script:validate_same_analyte_udf_value_for_
all_inputs -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -f 'Run Mode' -perPool false
```

- Registers the start time of the step by publishing messages to CLPA through ICA.

For Research Use Only. Not for use in diagnostic procedures.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

Validate Library Tube Strip Barcode Automation

Automatically triggered on the Placement screen, this automation validates the library tube strip barcode to make sure that it conforms to the barcode mask LC[0-9]{7}-LC1.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} script:validate_output_containers -l {compoundOutputFileLuid1} -r 'Library 8-tube Strip:LC[0-9]{7}-LC1' -max 1
```

Validate Run Setup and Create Planned Run Automation

Automatically triggered after a selection on the Record Details screen, this automation completes the following actions:

- Validates the parameters entered on the Record Details screen. These parameters are used to set up the run, generate the sample sheet file, and create the planned run in ICA, depending on the run mode.
  - Run Name can only contain alphanumeric, dash, underscore, or period characters. Do not use spaces.

    ```
    if (!step.::Run Name::.matches(::[a-zA-Z0-9-_]+[a-zA-Z0-9-_. ]*::)) { fail(::Run Name contains prohibited characters. Please check to make sure Run Name only contains alphanumeric characters, spaces, dashes and underscores. Run Name must start with alphanumeric, a dash or an underscore::); }
    ```

  - Run Name cannot exceed 255 characters.

    ```
    if (step.::Run Name::.length() > 255) { fail(::Run Name shall not exceed 255 characters.::); };
    ```

- Checks the Index 1 Cycles and Index 2 Cycles field values. If Index 2 Cycles is greater than 0, the Index 1 Cycles value must be greater than 0 or an error can occur.

```
if (step.::Index 2 Cycles:: > 0 && step.::Index 1 Cycles:: == 0) { fail(::Index 1 Cycles cannot be zero if Index 2 Cycles is non-zero::); };
```

- Generates the sample sheet. If you are in Cloud run mode, the automation creates the planned run in ICA. The sample sheet is attached to the step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:generate_sample_sheet -i {stepURI:v2} -u {username} -p {password} -c {compoundOutputFileLuid0} -l {compoundOutputFileLuid1}
```

There is a backend validation of the sample sheet content in ICA. This validation makes sure that the sample sheet is valid to set up a Local mode run and that it is ready for use with DRAGEN applications.

For more information on sample name character restrictions, refer to *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.

```
output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table shows the master step fields that are configured on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step. These fields are required for sample sheet generation and planned run creation in ICA.

Table 23 Clarity LIMS Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Cloud Run ID	Text	Read Only	Hidden Used for creating a planned run in ICA. Do not remove, rename, or modify this field as it can cause the integration to break.
Index 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Index 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Output Folder	Text		
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Presets • 51 • 101 • 151
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Presets • 51 • 101 • 151
Run Mode	Text Dropdown	Required Field	Presets • Local • Cloud
Run Name	Text	Required Field	

User Interaction

For more information, refer to the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.1 Validation and Troubleshooting* on page 86.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step is fully automated. The integration starts the step, adds samples to the Ice Bucket, and completes the step. Data from the run is parsed back to Clarity LIMS. In this step, pooled samples in the library tube strip are sequenced on the NovaSeq X Series instrument.

The following automations are configured on this step:

- Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted
- Register NovaSeq X RunCompleted & Register Step Completed

Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted Automation

Automatically triggered at the beginning of the step, this automation completes the following actions:

- Registers the start time of the step.
- Registers the NovaSeq X Series sequencing run configuration.
- Registers the association of the sequencing run with the samples by linking the Instrument Run ID with the sample ID.
- Registers the time that the sequencing run started.

This automation completes these actions by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-

script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_associate_seqrun.groovy'
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
```

```
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_started.groovy'
```

Register NovaSeq X RunCompleted & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the sequencing run completion time, run status, and run metrics. This script requires the Cloud Run ID custom field from the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.
- Registers the completion time of the step.

This automation completes these actions by publishing messages to CLPA through ICA.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_completed.groovy'
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following tables show the master step fields that are configured on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.

Table 24 Clarity LIMS Master Step Field Information

Field Name	Source File	Corresponding Field in Source File	Additional Information
Current Cycle	`RunCompletionStatus.xml`	CompletedReads	Visible on Record Details screen. Calculated based on the CompletedReads field.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Current Read	`RunCompletionStatus.xml` `RunParameters.xml`	CompletedReads PlannedReads	Visible on Record Details screen. Calculated based on the CompletedReads field in `RunCompletionStatus.xml` and PlannedReads field in `RunParameters.xml`.
Flow Cell Expiration Date	`RunParameters.xml`	ExpirationDate	Visible on Record Details screen. Corresponds to the value in the ExpirationDate field under the ConsumableInfo field for FlowCell Type.
Flow Cell ID	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value in the SerialNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Lot Number	`RunParameters.xml`	LotNumber	Visible on Record Details screen. Corresponds to the value in the LotNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Part Number	`RunParameters.xml`	PartNumber	Visible on Record Details screen. Corresponds to the value of the PartNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Side	`RunParameters.xml`	Side	Visible on Record Details screen.
Flow Cell Type	`RunParameters.xml`	FlowCellType	Visible on Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Instrument Control Software Version	`RunParameters.xml`	SystemSuiteVersion	Visible on Record Details screen.
Instrument ID	`RunParameters.xml`	InstrumentSerialNumber	Visible on Record Details screen.
Instrument Type	`RunParameters.xml`	InstrumentType	Visible on Record Details screen.
Output Folder	`RunParameters.xml`	OutputFolder	Visible on Record Details screen.
Library Tube Barcode	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value of the SerialNumber field under the ConsumableInfo field for SampleTube Type.
Library Tube Lot Number	`RunParameters.xml`	LotNumber	Hidden Do not remove, rename, or modify this field as it can cause the integration to break. Corresponds to the value of the LotNumber field under the ConsumableInfo field for SampleTube Type.
Run End Time	`RunCompletionStatus.xml`	RunEndTime	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Name	`RunParameters.xml`	ExperimentName	Visible on Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

Table 25 Other Clarity LIMS Master Step Fields

Field Name	Value	Additional Information
Run Status	Presets • RunStarted • RunCompletedSuccessfully • RunAbortedByUser • RunErroredOut Set by the SIS integration service.	Visible on Record Details screen.
Sequencing Log	Set by the SIS integration service during the sequencing run.	Visible on Record Details screen.
BaseSpace Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
ICA Project ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Instrument Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Start Time	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.

Global Fields

The following global custom fields are used to capture the run metrics in Clarity LIMS:

- % Bases >=Q30 R1
- % Bases >=Q30 R2

- % Error Rate R1
- % Error Rate R2
- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2
- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % PrePhasing R1
- % PrePhasing R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

At the end of the step, the pools of samples are automatically removed from the step. The step completes automatically when Run Status is RunCompletedSuccessfully.

How the Integration Works

The following information summarizes how the NovaSeq X Series integration works.

- After the Validate Run Setup and Create Planned Run automation is triggered on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step, the run parameters entered in the Run Details screen are sent to ICA. The analysis configuration parameters from the selected ACTs are also sent to ICA. ICA validates the run and analysis configuration. If the validation fails, ICA sends an error message to Clarity LIMS. If the validation passes, ICA generates the sample sheet and sends it back to Clarity LIMS. ICA also creates the planned run based on the selected run mode (eg, Local or Cloud).
  - For the Local run mode, the sample sheet is generated and stored in Clarity LIMS. This sample sheet contains the run and analysis configuration information required to start the run on the NovaSeq X Series instrument.

  - For the Cloud run mode, the planned run is created in ICA. The planned run contains the run and analysis configuration information required to start the run on the instrument. The sample sheet is generated and stored in Clarity LIMS for reference purposes.
- When the sequencing run starts on the instrument, the NovaSeq X Series Control Software notifies BaseSpace Sequence Hub. BaseSpace Sequence Hub monitors the run and uses the Stratus Integration Service (SIS) to notify Clarity LIMS. The events are processed and the integration service retrieves the run information from BaseSpace Sequence Hub. This information is used to populate the custom fields in the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.
- Other run events follow the same information flow. When sequencing is complete, the control software uploads the sequencing run data (primary metrics) and associated files to ICA. Then, Clarity LIMS retrieves the primary metrics and uses them to populate the fields in the Sample Details table (eg, % Error Rate R1). The custom fields (eg, Run Status, Current Read, and so on) on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step are updated using the run related information. If the sequencing run is successfully completed, the step automatically completes.
- The analysis results are not tracked. You must log in to BaseSpace Sequence Hub to retrieve the cloud analysis results. For local analysis, the secondary analysis results are found in the external storage configured in Illumina Run Manager. You can find this storage information under External Storage and Analysis Results.
- If a planned run with the same sample name and project name (case-insensitive) has been created previously in ICA, the sample sheet generated from the Validate Run Setup and Create Planned Run automation can reflect the original case of the previous sample name. This can cause validation errors for analysis configurations with sample-level settings. To resolve this issue, change the sample name or the project name on Clarity LIMS and run the automation again.

Start a Sequencing Run on NovaSeq X Series Instrument

The following sections outline the steps to start a Clarity LIMS cloud or local run on the NovaSeq X Series instrument.

Run Mode Configuration

1. In the NovaSeq X Series Control Software, log in to the instrument using an account that has permissions for configuring settings.
2. From the menu, select Settings.
3. From Settings, select Cloud settings.
4. Under Run Settings, select the Cloud run storage checkbox.
5. For Hosting location, select the applicable location from the drop-down options.

6. [Optional] For Private domain name, enter the domain name according to the workgroup that was configured with the NovaSeq X Series integration package.
7. Select Save.

Start a Sequencing Run in Local Run or Cloud Run Modes

You can start the sequencing run in BaseSpace Sequence Hub for both the Local and Cloud modes. Make sure that you log in using the account that was used during the NovaSeq X Series integration package setup. You must also import the sample sheet created from the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

Start a Sequencing Run in Local Run Mode

1. Log in with the BaseSpace Sequence Hub account and select the workgroup used during the NovaSeq X Series integration package installation.
2. Import the sample sheet created in the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step. Refer to information on creating a local run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.
3. When the sample sheet is selected, the contents are validated. After the validation passes, select Next.
4. Select Save As Planned.
   Run and analysis data is parsed and auto-populates in the list of runs. For more information on planning a NovaSeq X Series run, refer to the Plan a NovaSeq X Series Run section of the BaseSpace Sequence Hub Online Help at help.basespace.illumina.com and the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.
5. Start the run. Refer to information on starting a planned run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.

Start a Sequencing Run in Cloud Run Mode

To start a sequencing run in cloud run mode, refer to information on starting a planned run in the *NovaSeq X Plus Product Documentation* on the NovaSeq X Plus Sequencing System support site.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Reagent Kits

- Buffer Cartridge
- Lyophilization Cartridge
- NaOH
- Reagent Cartridge
- Resuspension Buffer (RSB)

- TT2

Container Types

- Library 8-Tube Strip
- Tube

This integration supports the library 8-tube strip with the barcode in the LC[0-9]{7}-LC1 format (eg, LC1234567-LC1).

Control Types

- PhiX v3

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- All submitted samples must have an associated secondary analysis that is configured using the analysis configuration template (ACT). The ACT must be configured on BaseSpace Sequence Hub before starting the Assign Analysis Configuration Template step. The ACT names must be unique.
- The library tube strip barcode must be unique. There must not be multiple library tube strip containers with the same name in the system.
- Reagent labels, or indexes, must be unique.
- One library pool can only contain one library or control with no label/index.
- The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step must not be manually started or completed. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, you must select Validate Run Setup and Create Planned Run in the Load to Library Tube step.

NovaSeq X Series Integration v1.1 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq X Series Integration Package v1.1.

The validation process involves the following actions:

- Running samples through the Library Prep Validation v2.3.1 workflow.

  - The workflow contains a single-step protocol that models the library prep required to produce libraries tagged with index sequences. At the end of the step, these libraries are routed to NovaSeq X Series Sequencing v1.0 workflow.
- Running libraries through the NovaSeq X Series Sequencing v1.0 workflow validates the following items:
  - Successful sequential step advancement of samples through the steps of the workflow.
  - Automatic validation of run setup information before sample sheet generation or planned run creation.
  - Automated sample sheet generation. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through the Local run mode.
  - Automated creation of a planned run in Illumina Connected Analytics (ICA). The control software retrieves the planned run. The run is started through the Cloud run mode.
  - Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics into Clarity LIMS.

The validation steps assume that the following conditions have been met:

- NovaSeq X Series Integration Package v1.1 is installed and you have imported the default Clarity LIMS configuration.
- Analysis configuration templates (ACTs) are created in BaseSpace Sequence Hub (BaseSpace Sequence Hub) for your run. Make sure that the index adapter kit label group is created in Clarity LIMS before selecting it in the ACT. This same label group is used in the Run Library Prep Validation v2.3.1 step. For more information on creating a reagent label group, refer to *Add and Configure Labels and Label Groups* in the Clarity LIMS Core Documentation. For the adapter sequences for your library prep kits, refer to *Illumina Adapter Sequences*.

Analysis Configuration Template Creation in BaseSpace Sequence Hub

You must create the Analysis Configuration Templates (ACTs) that are required for configuring secondary analysis in the NovaSeq X Series Sequencing v1.0 workflows. Create and delete ACTs in BaseSpace Sequence Hub. For instructions, refer to the BaseSpace Sequence Hub online help.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v2.3.1 and NovaSeq X Series Sequencing v1.0 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.3.1 and NovaSeq X Series Sequencing v1.0 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.

> Only use alphanumeric, dash, or underscore characters in the submitted sample names. Invalid characters can cause a sample sheet validation failure in the Load to Library Tube Strip step.

3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.1

This single-step protocol models the library prep required to produce libraries tagged with index sequences that are ready for the NovaSeq X Series Sequencing v1.0 workflow.

Run Library Prep Validation v2.3.1

1. In Lab View, locate the Library Prep Validation v2.3.1 protocol.
   Samples are queued for the Library Prep Validation v2.3.1 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, under Label Options, select the label groups that you want to use.
   The label group, or index adapter kit, selected must be the same as the Index Adapter Kit selected in the ACT that is being used.
4. Select Begin Work.
5. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
6. On the Add Labels screen, the Labels to Add list contains labels from the label group selected in step 3.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
7. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.

   > The Molarity (nM) values are used in the Calculate Volume automation script in the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step. If these values are not entered, the automation script does not work properly.

   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq X Series.
   c. Populate the fields in the Sequencing Instrument column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.

For Research Use Only. Not for use in diagnostic procedures.

- To populate all fields at one time, copy and paste from a spreadsheet.
- Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq X Series from the adjacent drop-down list. Select Apply.

If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
c. In the spreadsheet, enter the Molarity (nM) and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.
d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

8. Select Next Steps.
   This selection triggers the Set Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
9. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

10. Select Finish Step.
    On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq X Series Sequencing v1.0 workflow, Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0).

Protocol: NovaSeq X Series Sequencing v1.0

The NovaSeq X Series Sequencing v1.0 protocol consists of the following steps:

- Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)
- Make Bulk Pool (NovaSeq X Series Sequencing v1.0)
- Dilute and Denature (NovaSeq X Series Sequencing v1.0)
- Load To Library Tube Strip (NovaSeq X Series Sequencing v1.0)
- AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

Each step contains a script to register the start time (upon step entry) and the time that the step is completed (upon step exit). This information is published to CLPA through the ICA LINK service. These scripts are used only for CLPA support and can be incorporated as part of an automation that performs other functions.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The samples are queued for the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work to start the Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started automation.
   The automation checks that the sample names do not use restricted characters and are within character limits and retrieves the list of ACTs that you can select. The automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The part of the script for start time registration is used only for CLPA support.
4. Select the applicable ACT to assign to the samples. The index adapter kit specified by the ACT must correspond with the label group used in *Library Prep Protocol: Library Prep Validation v2.3.1* on page 88.
5. [Optional] Under Step Details, select Retrieve ACT Information to trigger the Retrieve ACT Information automation.
   This automation retrieves ACT information (eg, Library Prep Kit, Index Adapter Kit, Reference Genome, and so on) and populates the fields in Clarity LIMS. These details are saved to the `ACTMetadata.csv` file that you can download. If you are not sure of the analysis configuration before starting the sequencing and analysis run, refer to the details in the file.
6. Select Next Steps to assign the ACT to the samples.
   This action triggers the Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step automation. This automation validates that the indexes applied to the libraries are valid for the selected ACT and assigns samples to it. All samples added to the Ice Bucket in 2 are assigned to this ACT.
7. Select Finish Step.

To use multiple ACTs in a single run, repeat 2–7 for each ACT. For step 2, only add samples that are being assigned to that ACT into the Ice Bucket.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The samples are queued for the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.

For Research Use Only. Not for use in diagnostic procedures.

You can also add control samples by selecting them from the Available control samples drop-down list and selecting Add.

3. On the Ice Bucket screen, select Begin Work.
4. Create a pool of samples as follows.
   a. On the Pooling screen, create a pool by dragging samples into the Pool Creator.
   If a control sample was added, it appears under the Sample List and can be pulled into the pool that needs the control.
   b. Enter a name for your pool or accept the default name (Pool #1).
   c. [Optional] If multiple pools are required, select the plus sign (+) next to Pool Creator to create a pool.
   d. [Optional] To remove a pool, select the X in the top right corner of the pool.
   e. Select Record Details to trigger the Validate Analysis Configurations automation.
   This automation performs the following checks on the analysis configuration for each pool:
      - Pooled samples are within the maximum configuration limit.
      - Pooled samples have the sample type of analysis (Cloud or Local).
      - Pooled samples that have the same secondary analysis also have the same analysis version and settings.
5. On the Record Details screen, navigate to the Reagent Lot Tracking section to track the lot information used in the step.
6. [Optional] Create a new lot. For more information, refer to *Add and Configure Reagent Kits and Lots* in the Clarity LIMS LIMS Core Functionality documentation.
7. In the Step Details area, complete the following required fields:
   - Number of Lanes to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced. This field is applied to all pools in the step.
   - Final Loading Concentration (pM)—The final loading concentration of the pool in the flow cell.
   - Final Loading Volume (µl)—The final loading volume of the pool in the flow cell. This field is prepopulated with the configured default value (200 µl), but can be edited if more volume is required.
   - Minimum Per Sample Volume (µl)—The minimum volume for each sample. This field is prepopulated with the configured default value (2 µl) and can be edited. If the per sample volume is below the value set in this field, the Calculate Volumes script applies a rounding factor to affected samples so that the volume reaches the minimum volume.
   - % PhiX (2.0nM) Spike-In—The value entered in this field is used to calculate the volume of PhiX spike-in required.
   - Flowcell Type—This is a read-only field configured with the default value of B3.
8. Select Calculate Volumes to trigger the Calculate Volumes automation.

For Research Use Only. Not for use in diagnostic procedures.

This automation calculates the volumes required for each library to form a pool that has the concentration and volume specified in the Step Details field. This automation is applied to control samples when they are indexed and molarity is specified. It also generates the calculation file in a CSV format and attaches it to the step. You can select the file name to download it.

9. In the Sample Details table, select the pool next to the sample name to view details on the pool composition.
10. Select Next Steps to trigger the Set Next Step automation.
    This automation sets the next step for samples to ADVANCE, which moves them to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.
11. Select Finish Step.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The pool of samples queued for the Dilute and Denature (NovaSeq X Series Sequencing v1.0) displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the library tube strip) and select Begin Work.
   - On entry to the step, the Validate Inputs Flowcell Type and Register Step Started automation is triggered. This automation makes sure that the configured flow cell type is valid. The automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The portion of the script used for start time registration is used only for CLPA support.
   - On entry to the Record Details screen, the Calculate Volumes automation is triggered.
     This automation sets the following values:
     - BP Aliquot Volume (µl)
     - RSB Volume (µl)
     - NaOH Volume (µl)
     - TT2 Volume (µl)
     - The automation also generates the calculation file (CSV) and attaches it to the step. This file contains information about the volume of RSB, NaOH, and TT2 to add per working pool.
4. On the Record Details screen, the Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and TT2 reagents used in the step. To add and activate reagent lots, do as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select one of the reagent kits previously listed (eg, NaOH) and select New Lot.
   d. Enter the lot details.
   e. Select Save.

For Research Use Only. Not for use in diagnostic procedures.

f. Set the Status of Reagent Lot toggle switch to Active.

g. Repeat this process to add and activate the remaining reagent lots.

h. Return to your original working browser tab and refresh the page.

5. On the Record Details screen, perform the following actions:

a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.

b. In the Sample Details table, make sure that the BP aliquot, RSB, NaOH, and TT2 reagent volume values are populated. The script sets these values and they cannot be edited.

c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.
The working pool number is appended to the bulk pool name so that you can identify which working pools are derived from the same bulk pool.

6. In the Files area, select the Calculation File (CSV) to open it and view details on the RSB, NaOH, and TT2 volumes to add per working pool.

7. Select Next Steps.

8. Select Finish Step.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The pool of samples are queued for the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

2. Add the pools to the Ice Bucket and select View Ice Bucket.

3. On the Ice Bucket screen, select Begin Work to trigger the Validate Analysis Configurations and Register Step Started automation.
This automation performs the following basic checks on the analysis configuration for each pool:

- Pooled samples are within the maximum configuration limit.
- Pooled samples have the sample type of analysis (Cloud or Local).
- Pooled samples that have the same secondary analysis also have the same analysis version and settings.

The automation also registers the start time of the step by publishing messages to CLPA through the ICA LINK service. The portion of the script used for start time registration is used only for CLPA support.

4. On the Placement screen, do as follows.

a. Drag the pool into the Library 8-tube Strip in the Placed Samples area on the right.

b. Scan or type the barcode of the Library 8-tube Strip into the Library 8-tube Strip container name field.

c. Select Record Details.

After exiting the Placement screen, the Validate Library Strip Tube Barcode automation makes sure that the library tube strip barcode conforms to the barcode mask LC[0-9]{7}-LC1.

For Research Use Only. Not for use in diagnostic procedures.

5. The fields displayed on the Record Details screen are used to create the planned run and generate the sample sheet.
   The analysis related information for the planned run is from the ACT associated with the samples and no further analysis configuration is required. Refer to the following table for details.

   Table 26 Fields Displayed on Record Details Screen of Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) Step

Field	Value
Run Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
Run Mode	The selected Run Mode must correspond to the ACT type. Presets • Local[1] • Cloud[2]
Read 1 Cycles	Presets • 151 • 101 • 51 • Type a custom value
Read 2 Cycles	Presets • 151 • 101 • 51 • Type a custom value
Index 1 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]
Index 2 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]

   [1] The Local run mode generates the sample sheet. The Run/Analysis configuration is imported manually to the NovaSeq X Series instrument through the sample sheet. The sample sheet is downloaded and imported manually by the user on NovaSeq X Control Software to start the run. The downstream secondary analysis is done using the onboard DRAGEN module.
   [2] The Cloud run mode sends the Run/Analysis configuration to ICA. This configuration is downloaded to the NovaSeq X Series instrument through ICA to start the run. The downstream secondary analysis is done in the cloud.

For Research Use Only. Not for use in diagnostic procedures.

[3] The custom value must correspond to the longest index sequence of the samples in the pools in the library tube strip. Otherwise, the planned run creation fails and an error message displays.

6. Select Validate Run Setup and Create Planned Run to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Creates the planned run and sends it to ICA when the Run Mode is Cloud.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen for all Run Mode types.
7. Select Next Steps.
   On the Assign Next Steps screen, the next step for the pooled samples is set to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.
8. Select Finish Step to advance the pooled samples to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step. For more information on how to start the sequencing run for different run modes, refer to *NovaSeq X Series Integration v1.1 Configuration and User Interaction on page 56*.
9. To use multiple ACTs in a single run, repeat steps 1–3 for each ACT. The pool of samples (for different ACTs) are then queued for the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step to be added to the Ice Bucket.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

This protocol contains the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step. This step is fully automated.

Do not add samples to the Ice Bucket or start or complete the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step. The integration does this automatically.

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics in the Step Details section and the Sample Details table.

Step Details Section

The following values populate the master step fields:

- Run Name
- Run Status
- Output Folder

- Current Read
- Current Cycle
- Library Tube Barcode
- Flow Cell ID
- Flow Cell Side
- Flow Cell Type
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Sequencing Log

Sample Details Table

Summary metrics populate the following global custom fields:

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2
- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2

- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the *Troubleshooting Automation* section in the Clarity LIMS API & Database documentation.

Automated Step Does Not Start

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step does not start, Clarity LIMS is likely not receiving sequencing run events from BaseSpace Sequence Hub correctly. Check for the following issues:

1. Make sure that the NovaSeq X Control Software is configured properly as follows.
    a. Before you start the run, in the NovaSeq X Control Software, select the appropriate BaseSpace Sequence Hub region in the Hosting location drop-down list.
    b. Under Run Settings, check the boxes next to Cloud run monitoring and Cloud run storage.

If there are issues after using the configuration settings on the NovaSeq X Control Software, contact Illumina Support.

Automated Step Starts, But Does Not Complete

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step starts, but does not complete, do as follows.

1. Log in to the default user account and use one of the following methods to open the in progress step in Clarity LIMS:
    a. In Lab View, find the step in the Recent Activities pane.
    b. Search for the step in Clarity LIMS using the library tube strip barcode as the search term.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Validate Analysis Configuration Automation Check Fails

The Validate Analysis Configuration automation check is in the Make Bulk Pool (upon pooling) and Load to Library Tube Strip (upon step entry) steps. If a failure happens, an error message displays and the step can be aborted, or you might be prevented from continuing the step. This check can fail for the following reasons:

- The analysis configuration after library pooling or during the planned run creation exceeds the configuration limit. Resolve this error as follows.
  - If the error occurs on the Make Bulk Pool step, reduce the number of analysis configurations for a pool. To reduce the number, reorganize the samples for the pooling step (eg, by pooling samples that have similar configurations together).
  - If the error occurs on the Load to Library Tube step, reduce the number of analysis configurations for the planned run by reorganizing the samples for multiple runs instead of a single run.
- ACTs of samples in the same pool or planned run must have the same run mode (Local or Cloud). Resolve this error as follows.
  1. Abort the step and remove samples with ACTs that have conflicting run modes from the Ice Bucket.
  2. Make sure that all remaining samples in the Ice Bucket have ACTs with the same run modes.
  3. Select Begin Work to continue the step.
- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis version. Resolve this error as follows.
  - If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different pools.
  - If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different runs.
- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis settings. The analysis setting fields can differ for a different secondary analysis and are configured in BaseSpace Sequence Hub when the ACT is created. Resolve this error as follows.
  1. If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different pools.
  2. If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different runs.

NovaSeq X Series Integration v1.1 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeq X Series Integration Package v1.1.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v6.2 and later
- NGS Extensions Package v5.23 and later
- Illumina Preset Protocols (IPP) v2.6.0 and later
- NovaSeq X Series Control Software v1.0.0

New Features

- Updated Java and third-party dependency libraries.
- Updated Groovy to v3.0.7.

Defects Fixed

- Restricted the scope for the JWT token used in the integration.
- Fixed issue where the SIS core service was not properly registered in systemctl.

Known Limitations

- This integration does not track the analysis step. You must log in to BaseSpace Sequence Hub to view the cloud analysis status and results. For local analysis, the secondary analysis results are located in the external storage configured in Illumina Run Manager.
- The Local run mode does not support custom library prep and index adapter kits.
- The Analysis Configuration Template (ACT) names must be unique.

Known Issues

- On the Make Bulk Pool step, the log displays a warning when the Calculate Volume automation is triggered and at least one pool consists of multiple inputs. This issue is caused by the output custom field being reset multiple times at the end of the automation. This issue does not affect the volume calculation.

NovaSeq X Series Integration v1.0 Configuration and User Interaction

The Illumina NovaSeq X Series Integration Package v1.0 supports the integration of Clarity LIMS to Illumina NovaSeq X series instruments. This integration supports Clarity LIMS v5.1 and later.

For instructions on validating and troubleshooting the Illumina NovaSeq X Series Integration, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

The configuration provided in this integration has been established to support NovaSeq X Series lab processes. Any configuration changes to protocols or workflows (including renaming protocols, steps, and fields) could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq X Series Sequencing v1.0 workflow that maps to lab protocols and instrument runs.
- The following steps in the NovaSeq X Series Sequencing v1.0 preconfigured protocol:
  - Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)
  - Make Bulk Pool (NovaSeq X Series Sequencing v1.0)
  - Dilute and Denature (NovaSeq X Series Sequencing v1.0)
  - Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)
  - AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)
- Automatic validation of run setup information before sample sheet generation or planned run creation.
- Automated generation of the sample sheet. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through Local run mode.
- Automated creation of a planned run on Illumina Connected Analytics (ICA). The NovaSeq X Series Control Software retrieves the planned run for use with the Cloud run mode.
- Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics into Clarity LIMS using the Stratus Integration Service (SIS).
- [Optional] Preconfigured Library Prep Validation v2.3.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce libraries that are ready for the NovaSeq X Series Sequencing v1.0 workflow. For more information, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129. The Library Prep Validation v2.3.0 workflow is available in the Illumina Preset Protocols (IPP) v2.5 package.
- [Optional] Clarity LIMS Product Analytics integration that can be used with ICA. The Clarity LIMS Product Analytics integration installation and configuration is required. For more information, refer to *Clarity LIMS Product Analytics Service Integration v1.1 Installation* and *Clarity LIMS Product Analytics Integration v1.1 Configuration and User Interaction* on page 2415.

Prerequisites and Assumptions

Analysis Configuration Template

The NovaSeq X Series Sequencing v1.0 workflow uses analysis configuration templates (ACTs) to configure secondary analysis for planned runs. Required ACTs must be created using BaseSpace Sequence Hub. The index adapter kit (the label group in Clarity LIMS) selected in the ACT is created in Clarity LIMS. The same label group must be used in the library preparation step. For more information, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Make sure that ACT names created in BaseSpace Sequence Hub do not have leading or trailing spaces. Otherwise, Clarity LIMS can have issues with recognizing the ACT names.

Samples

Samples must go through the library preparation and quantification process before they enter the NovaSeq X Series Sequencing v1.0 workflow. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have the Molarity (nM) global field set to a value. This value is required for the Calculate Volumes automation in the Make Bulk Pool step.

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The NovaSeq X Series Integration Package v1.0 includes the following workflows:

- NovaSeq X Series Sequencing v1.0
- Library Prep Validation v2.3.0 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 27 NovaSeq X Series Integration Package v1.0 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.0 Workflow		
Library Prep Validation v2.3.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the NovaSeq X Series Sequencing v1.0 workflow. The protocol contains a single step - Library Prep Validation v2.3.0. After this step, a routing script sends the samples to the first step of the NovaSeq X Series Sequencing v1.0 workflow (Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)).	1. Library Prep Validation v2.3.0
NovaSeq X Series Sequencing v1.0 Workflow		

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq X Series Sequencing v1.0	Allows for the assignment of per sample values for the following properties: 1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) • The secondary analysis of samples is configured using the ACT. • The labels applied to the samples are validated against the selected ACT so that samples use valid labels. 2. Make Bulk Pool (NovaSeq X Series Sequencing v1.0) • The Calculate Volumes script assists with pooling samples and adding resuspension buffers and reagents. • The Validate Analysis Configurations automation validates the ACT of pooled samples to make sure that the secondary analysis configurations remain valid after pooling. 3. Dilute and Denature (NovaSeq X Series Sequencing v1.0) • The Calculate Volumes script helps denature and dilute samples from step 2 to the final loading concentration. 4. Load To Library Tube Strip (NovaSeq X Series Sequencing v1.0) • The library pools from step 3 are ready to be loaded to the NovaSeq X Series library tube strip. • Validates run and analysis information. • Generates the sample sheet and creates the planned run. 5. AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) • The step is fully automated and starts and completes automatically after the sequencing run is started and completed on the instrument side. • The sequencing run metadata (eg, run configuration, primary run metrics, and so on) are recorded automatically. • The integration does this step	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) 2. Make Bulk Pool (NovaSeq X Series Sequencing v1.0) 3. Dilute and Denature (NovaSeq X Series Sequencing v1.0) 4. Load To Library Tube Strip (NovaSeq X Series Sequencing v1.0) 5. AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

For Research Use Only. Not for use in diagnostic procedures.

Validation Workflow

The Library Prep Validation v2.3.0 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Step Automations

The following table lists the step automations included in the NovaSeq X Series Sequencing v1.0 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Table 28 NovaSeq X Series Sequencing v1.0 Workflow Step Automations

Protocol	Step	Automation
NovaSeq X Series Sequencing v1.0	1. Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)	Register Step Completed[1] Retrieve ACT Information Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started[2]
	2. Make Bulk Pool (NovaSeq X Series Sequencing v1.0)	Calculate Volumes Register Pools and Register Step Completed[1] Register Step Started[1] Set Next Step Validate Analysis Configurations
	3. Dilute and Denature (NovaSeq X Series Sequencing v1.0)	Calculate Volumes Register Step Completed[1] Set Next Step Validate Inputs Flowcell Type and Register Step Started[2]
	4. Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)	Register Step Completed[1] Set Next Step Validate Analysis Configurations and Register Step Started[2] Validate Library Tube Strip Barcode Validate Run Setup and Create Planned Run
	5. AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)	Register NovaSeq X RunCompleted and Register Step Completed[1] Register Step Started and Register NovaSeq X Run and Register NovaSeq X Run Association and Register NovaSeq X RunStarted[1]

[1] These automations are required for Clarity LIMS Product Analytics support only.
[2] These automations are required for the NovaSeq X Series Sequencing v1.0 workflows and contain additional logic needed for Clarity LIMS Product Analytics support. If you would like to remove support for Clarity LIMS Product Analytics, contact Illumina Support.

All remaining automations are required for the NovaSeq X Series Sequencing v1.0 workflows.

For Research Use Only. Not for use in diagnostic procedures.

The Illumina Universal Sample Identifier is a global field that is imported with the Library Prep Validation v2.3.0 and NovaSeq X Series Sequencing v1.0 workflows. Illumina Universal Sample Identifier is a text field that is reserved for Clarity LIMS Product Analytics support. The field is optional and not required for this integration.

Terminology

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)

The Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step uses ACTs to configure secondary analysis for samples. Each ACT contains details related to the secondary analysis (eg, index adapter kit to use, reference genome setting, and so on). You can select an ACT from a list and assign samples to it. A planned run can have multiple ACTs and this step must be repeated for each ACT that is required for the run. For more information on creating ACTs and assigning samples to them, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

The following automations are configured on this step:

- Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started
- Retrieve ACT Information
- Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step
- Register Step Completed

Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started Automation

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that submitted sample names contain only alphanumeric, dash, and underscore characters.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -exp 'submittedSamples.each { sample -> if (
!sample.name.matches( ::[A-Za-z0-9_-]+:: ) ) { fail ( ::Submitted sample :: +
sample.name + :: should only have alphanumeric, dash, and underscore characters.
Please rename and try again.:: ) } }' -log {compoundOutputFileLuid1}
```

This script is required for the NovaSeq X Series Sequencing v1.0 workflow.

- Retrieves the list of ACTs that were created in BaseSpace Sequence Hub.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:retrieve_act_list -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1}
```

This script is required for the NovaSeq X Series Sequencing v1.0 workflow.

- Registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Retrieve ACT Information Automation

Automatically triggered when you select Retrieve ACT Information on the Record Details screen, this automation completes the following actions:

- Retrieves the details of the selected ACT and populates the step custom fields (eg, Analysis Version, Library Prep Kit, and so on).
- Saves the details into a file that is available to download. This file is stored in the Analysis Configuration Metadata file placeholder.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:retrieve_act_info -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration
Template}'
```

Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Checks that the molarity of all samples is specified.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'if (!input.hasValue
(::Molarity (nM)::)) { fail(::The Molarity cannot be empty.::) ; } else if
(input.::Molarity (nM):: <= 0) { fail(::The Molarity cannot be negative or
zero.::) ; }' -log {compoundOutputFileLuid1}
```

- Checks that all samples are indexed and for invalid indexes. The indexes applied are the same as the selected ACT.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:validate_indexes -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -a '{udf:Analysis Configuration
Template}'
```

- Assigns the selected ACT to all samples in the step.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:assign_act -i {stepURI:v2} -u {username} -p {password} -
a '{udf:Analysis Configuration Template}' -l {compoundOutputFileLuid1}
```

- Sets the next step for samples to ADVANCE, which advances them to the next step in the protocol (Make Bulk Pool (NovaSeq X Series Sequencing v1.0)).

```
nextStep = ::ADVANCE:
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers completion time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Master Step Fields

There are seven fields defined on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step. The following table lists field configuration details.

Table 29 Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) Master Step Field Configuration

Field Name	Field Type	Options
Analysis Configuration Template	Text Dropdown	Required Field
Application	Text	Read Only
Application Version	Text	Read Only
Index Adapter Kit	Text	Read Only
Library Prep Kit	Text	Read Only
Reference Genome	Text	Read Only
Secondary Analysis Mode	Text	Read Only

Global Fields

The following table lists the global custom fields that are configured to display on the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step.

Table 30 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Molarity (nM)	Numeric		Decimal places displayed = 2
ACT Name	Text	Read Only	

User Interaction

For more information, refer to the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.0)

Samples are pooled in the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step. You can manually create working pools based on the final loading concentration required.

The following automations are configured on this step:

- Register Step Started
- Validate Analysis Configurations
- Calculate Volumes

- Set Next Step
- Register Pools & Register Step Completed

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Validate Analysis Configurations Automation

Automatically triggered on exit of the Pooling screen, this automation performs analysis configuration validity and checks each pool for the following characteristics:

- Pooled samples are within the maximum configuration limit.
- Pooled samples have the same type of analysis (eg, Cloud or Local).
- Pooled samples that have the same secondary analysis also have the same analysis version (eg, v3.8.4).
- Pooled samples that have the same secondary analysis and analysis version also have the same analysis settings (eg, Map/Align Output Format = CRAM).

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxseries-automation.jar script:validate_physical_logical_configurations -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -m PerPool script:validate_analysis_config -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -m PerPool && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar script:validate_same_analyte_udf_value_for_all_inputs -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -f 'Run Mode' -perPool true
```

Calculate Volumes Automation

Automatically triggered when you select Calculate Volumes on the Record Details screen, this automation completes the following actions:

- Proceeds if the sample has molarity values.

```
if (!input.hasValue(::Molarity (nM)::)) { return; };
```

- Uses Number of Samples in Pool to calculate the volumes needed for the 2 nM intermediate library pools.

```
if (output.hasValue(::Number of Samples in Pool::)) { output.::Number of Samples in Pool:: = output.::Number of Samples in Pool:: + 1; } else { output.::Number of Samples in Pool:: = 1; }' -t true
```

- Uses the Bulk Pool Volume (µl) field and Number of Lanes to Sequence (x100) for the B3 flow cell type to calculate volumes needed for the 2 nM intermediate library pools.
- Copies the Final Loading Concentration (pM) and Flowcell Type from the step inputs to the step outputs.

```
if (step.::Flowcell Type:: == ::B3::) { output.::Bulk Pool Volume (ul):: = 100 * step.::Number of Lanes to Sequence::; }; output.::NovaSeq X Flowcell Type:: = step.::Flowcell Type::; output.::Final Loading Concentration (pM):: = step.::Final Loading Concentration (pM)::;
```

- Calculates the per sample volume required for each library to make a 2 nM intermediate library pool.

```
input.::Per Sample Volume (ul):: = 2 * output.::Bulk Pool Volume (ul):: / input.::Molarity (nM):: / output.::Number of Samples in Pool::;
```

- If PhiX is used for a planned run (eg, a value for % PhiX (2.0 nM) Spike-In is specified), sets the PhiX Volume (µl).

```
if (step.hasValue(::% PhiX (2.0nM) Spike-In::)) { step.::PhiX Volume (ul):: = step.::% PhiX (2.0nM) Spike-In:: / 100 * step.::Final Loading Volume (ul)::; };
```

- Calculates the adjusted per sample volume for the pools.

```
script:calculate_multipool_adjusted_per_sample_volume -t
```

- Uses the Total Sample Volume (µl) to calculate the RSB volume (µl) required to top up the pools that are needed to create the 2 nM intermediate library pools. The RSB volume is saved to the file in the Calculation File placeholder in the Files section.

```
script:evaluateDynamicExpression \
-exp 'if (output.hasValue(::Total Sample Volume (ul)::)) { output.::Total Sample Volume (ul):: = output.::Total Sample Volume (ul):: + input.::Adjusted Per Sample Volume (ul)::; } else { output.::Total Sample Volume (ul):: = input.::Adjusted Per Sample Volume (ul)::; }' -t true \
script:evaluateDynamicExpression \
-exp 'if (output.::Total Sample Volume (ul):: > output.::Bulk Pool Volume (ul)::) { output.::RSB Volume (ul):: = 0 } else { output.::RSB Volume (ul):: = output.::Bulk Pool Volume (ul):: - output.::Total Sample Volume (ul):: }' -t true \
```

- Uses the NovaSeqXSeries_Bulk_Pool1.csv and NovaSeqXSeries_Bulk_Pool2.csv template files to generate a single CSV file. This file contains information about the pools and the samples that they contain. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_
Pool1.csv -o 1.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Bulk_
Pool2.csv -o 2.csv \
&& cat 1.csv 2.csv > {compoundOutputFileLuid0}.csv \
```

- Resets the Number of Samples in Pool, Total Sample Volume (µl), and Bulk Pool Volume (µl) to null before exiting the step.

```
-exp 'output.::Number of Samples in Pool:: = ::::; output.::Total Sample Volume
(ul):: = ::::; output.::Bulk Pool Volume (ul):: = ::::;' -t true
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Proceeds only if the sample has a molarity value.
- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, which advances them to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -
log {compoundOutputFileLuid1} \
script:evaluateDynamicExpression -exp 'if (!input.hasValue(::Molarity (nM)::)){
return; }; output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::;'"
```

Register Pools & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the pool and library information used by the Clarity LIMS workflow. Samples in the pool are assumed to have gone through library prep.
- Registers completion time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -
jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
```

```
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Master Step Fields

There are seven fields defined on the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step. The following table lists configuration details.

Table 31 Make Bulk Pool (NovaSeq X Series Sequencing v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	
Final Loading Volume (µl)	Numeric	Required Field	Default • 200
Flowcell Type	Text	Required Field Read Only	Default • B3
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 2
Number of Lanes to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0

Field Name	Field Type	Options	Additional Options and Dropdown Items
PhiX Volume (µl)	Numeric	Read Only	Hidden Decimal places displayed = 1 Used for Calculate Volume script when there is PhiX spike-in. Do not remove, rename, or modify this field as it can cause the integration to break.

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.

Table 32 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed = 0 Presets • 225 • 400
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
NovaSeq X Flowcell Type	Text	Required Field Read Only	Default • B3

User Interaction

For more information, refer to Run Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.0)

The Dilute and Denature (NovaSeq X Series Sequencing v1.0) step allows you to dilute pooled samples with the addition of RSB.

The following automations are configured on this step:

- Validate Inputs Flowcell Type and Register Step Started
- Calculate Volumes
- Set Next Step
- Register Step Completed

Validate Inputs Flowcell Type and Register Step Started

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the specified flow cell type is valid.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -h false -exp 'if (!input.hasValue(::NovaSeq X
Flowcell Type::)){fail(::Invalid Flowcell Type custom field value. Please make
sure all input samples have a value assigned for Flowcell Type custom
field.::)}' -log {compoundOutputFileLuid1}
```

  This script is required for the NovaSeq X Series Sequencing v1.0 workflow.

- Registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

  This automation is used only for Clarity LIMS Product Analytics support.

Calculate Volumes Automation

Automatically triggered when you enter the Record Details screen, this automation completes the following actions:

- Checks that the NovaSeq X Flowcell Type is B3 and sets NaOH Volume (µl) and TT2 Volume (µl) field values to 10 and 150.
- Computes BP Aliquot Volume (µl) and RSB Volume (µl) required for the dilution of pools to the required final loading concentration.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -
log {compoundOutputFileLuid1} \
```

```
script:evaluateDynamicExpression \
-exp 'if (input.::NovaSeq X Flowcell Type:: == ::B3::) { output.::NaOH Volume
(ul):: = 10; output.::TT2 Volume (ul):: = 150; }; output.::BP Aliquot Volume
(ul):: = input.::Final Loading Concentration (pM):: * 200 / (2 * 1000);
output.::RSB Volume (ul):: = 40 - output.::BP Aliquot Volume (ul)::;'
```

- Generates a single CSV file that contains information about the reagents volume required to dilute the working pools. The generated file is stored in the Calculation File placeholder in the Files section.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqXSeries_Dilute_
Denature_Calculate_Volumes.csv -o {compoundOutputFileLuid0}.csv -q true -
destLIMSID {compoundOutputFileLuid0} -l {compoundOutputFileLuid1}"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -t false -h false -exp 'output.::Run Mode:: =
input.::Run Mode::; nextStep = ::ADVANCE::' -log {compoundOutputFileLuid1}
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.

Table 33 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
TT2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

For more information, refer to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)

The Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step allows you to scan the library tube barcode into Clarity LIMS. Then, you can place the working pools into the library tube strip used in the NovaSeq X Series run. This step also does the following actions:

- Validates the run setup and analysis information.
- Generates the sample sheet file.
- Creates a planned run on ICA, depending on the selected run mode.

The following automations are configured on this step:

- Validate Input Count and Validate Analysis Configurations and Register Step Started
- Validate Library Tube Strip Barcode
- Validate Run Setup and Create Planned Run
- Set Next Step
- Register Step Completed

Validate Input Count and Validate Analysis Configurations and Register Step Started

Automatically triggered on entry to the step, this automation completes the following actions:

- Checks that the number of input pools is the same as the number of tubes in the library tube strip.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:validateSampleCount -min 8 -max 8
```

  This script is required for the NovaSeq X Series Sequencing v1.0 workflow.

- Performs basic checks on the secondary analysis configuration of the samples in the same planned run. The following checks are included in this script:
  - Secondary analysis configuration of samples in a planned run is within maximum configuration limit.
  - Samples in a planned run have the same type of analysis (eg, Cloud or Local).
  - Samples in a planned run that have the same secondary analysis and analysis version (eg, Illumina DRAGEN Enrichment) also have the same analysis settings (eg, Map/Align Output Format = CRAM).
  - Samples in a planned run that have the same secondary analysis have the same analysis version (eg, v3.8.4).

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxser
ies-automation.jar script:validate_physical_logical_configurations -i
{stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -m
PerRun script:validate_analysis_config -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} -m PerRun &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar script:validate_same_analyte_udf_value_for_
all_inputs -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -f 'Run Mode' -perPool false
```

  This script is required for the NovaSeq X Series Sequencing v1.0 workflow.

- Registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy'
```

  This script is used only for Clarity LIMS Product Analytics support.

Validate Library Tube Strip Barcode Automation

Automatically triggered on the Placement screen, this automation validates the library tube barcode to make sure that it conforms to the barcode mask LC[0-9]{7}-LC1.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:validate_output_containers -l {compoundOutputFileLuid1} -r 'Library 8-
tube Strip:LC[0-9]{7}-LC1' -max 1
```

Validate Run Setup and Create Planned Run Automation

Automatically triggered after a selection on the Record Details screen, this automation completes the following actions:

- Validates the parameters entered on the Record Details screen. These parameters are used to set up the run, generate the sample sheet file, and create the planned run in ICA.
  - Run Name can only contain alphanumeric, dash, underscore, or period characters. Do not use spaces.

    ```
    if (!step.::Run Name::.matches(::[a-zA-Z0-9-_]+[a-zA-Z0-9-_. ]*::)) { fail
    (::Run Name contains prohibited characters. Please check to make sure Run
    Name only contains alphanumeric characters, spaces, dashes and underscores.
    Run Name must start with alphanumeric, a dash or an underscore::); }
    ```

  - Run Name cannot exceed 255 characters.

    ```
    if (step.::Run Name::.length() > 255) { fail(::Run Name shall not exceed 255
    characters.::); };
    ```

- Checks the Index 1 Cycles and Index 2 Cycles field values. If Index 2 Cycles is greater than 0, the Index 1 Cycles value must be greater than 0 or an error can occur.

```
if (step.::Index 2 Cycles:: > 0 && step.::Index 1 Cycles:: == 0) { fail(::Index
1 Cycles cannot be zero if Index 2 Cycles is non-zero::); };
```

- Generates the sample sheet. If you are in Cloud run mode, the automation creates the planned run in ICA. The sample sheet is attached to the step.

```
/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/SIS/SISServices/extensions/automation/novaseqxserie
s-automation.jar script:generate_sample_sheet -i {stepURI:v2} -u {username} -p
{password} -c {compoundOutputFileLuid0} -l {compoundOutputFileLuid1}
```

There is a backend validation of the sample sheet content in ICA. This validation makes sure that the sample sheet is valid to set up a Local mode run and that it is ready for use with DRAGEN applications.

For more information on sample name character restrictions, refer to *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Run Mode from input to output.
- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.

```
output.::Run Mode:: = input.::Run Mode::; nextStep = ::ADVANCE::
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Master Step Fields

The following table shows the master step fields that are configured on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step. These fields are required for sample sheet generation and planned run creation in ICA.

Table 34 Clarity LIMS Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Cloud Run ID	Text	Read Only	Hidden Used for creating a planned run in ICA. Do not remove, rename, or modify this field as it can cause the integration to break.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Index 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Index 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Presets • 0 • 6 • 8
Output Folder	Text		
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Presets • 51 • 101 • 151
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Presets • 51 • 101 • 151
Run Mode	Text Dropdown	Required Field	Presets • Local • Cloud
Run Name	Text	Required Field	

User Interaction

For more information, refer to the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step section in *NovaSeq X Series Integration v1.0 Validation and Troubleshooting* on page 129.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step is fully automated. The integration starts the step, adds samples to the Ice Bucket, and completes the step. Data from the run is parsed back to Clarity LIMS. In this step, pooled samples in the reagent cartridge are sequenced on the NovaSeq X Series instrument.

The following automations are configured on this step:

- Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted
- Register NovaSeq X RunCompleted & Register Step Completed

Register Step Started & Register NovaSeq X Run & Register NovaSeq X Run Association & Register NovaSeq X RunStarted Automation

Automatically triggered at the beginning of the step, this automation completes the following actions:

- Registers the start time of the step.
- Registers the NovaSeq X Series sequencing run configuration.
- Registers the association of the sequencing run with the samples by linking the Instrument Run ID with the sample ID.
- Registers the time that the sequencing run started.

This automation completes these actions by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/common/step_started.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/register_novaseqxseries_run.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_associate_seqrun.groovy'
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s
'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_started.groovy'
```

The automation is used only for Clarity LIMS Product Analytics support.

Register NovaSeq X RunCompleted & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Registers the sequencing run completion time, run status, and run metrics. This script requires the Cloud Run ID custom field from the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

- Registers the completion time of the step.

This automation completes these actions by publishing messages to Clarity LIMS Product Analytics through the LINK service.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/novaseqxseries/novaseqxseries_seqrun_completed.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

This automation is used only for Clarity LIMS Product Analytics support.

Master Step Fields

The following tables show the master step fields that are configured on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.

Table 35 Clarity LIMS Master Step Field Information

Field Name	Source File	Corresponding Field in Source File	Additional Information
Current Cycle	`RunCompletionStatus.xml`	CompletedReads	Visible on Record Details screen. Calculated based on the CompletedReads field.
Current Read	`RunCompletionStatus.xml` `RunParameters.xml`	CompletedReads PlannedReads	Visible on Record Details screen. Calculated based on the CompletedReads field in `RunCompletionStatus.xml` and PlannedReads field in `RunParameters.xml`.
Flow Cell Expiration Date	`RunParameters.xml`	ExpirationDate	Visible on Record Details screen. Corresponds to the value in the ExpirationDate field under the ConsumableInfo field for FlowCell Type.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Flow Cell ID	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value in the SerialNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Lot Number	`RunParameters.xml`	LotNumber	Visible on Record Details screen. Corresponds to the value in the LotNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Part Number	`RunParameters.xml`	PartNumber	Visible on Record Details screen. Corresponds to the value of the PartNumber field under the ConsumableInfo field for FlowCell Type.
Flow Cell Side	`RunParameters.xml`	Side	Visible on Record Details screen.
Flow Cell Type	`RunParameters.xml`	FlowCellType	Visible on Record Details screen.
Instrument Control Software Version	`RunParameters.xml`	SystemSuiteVersion	Visible on Record Details screen.
Instrument ID	`RunParameters.xml`	InstrumentSerialNumber	Visible on Record Details screen.
Instrument Type	`RunParameters.xml`	InstrumentType	Visible on Record Details screen.
Output Folder	`RunParameters.xml`	OutputFolder	Visible on Record Details screen.

Field Name	Source File	Corresponding Field in Source File	Additional Information
Library Tube Barcode	`RunParameters.xml`	SerialNumber	Visible on Record Details screen. Corresponds to the value of the SerialNumber field under the ConsumableInfo field for SampleTube Type.
Library Tube Lot Number	`RunParameters.xml`	LotNumber	Hidden Do not remove, rename, or modify this field as it can cause the integration to break. Corresponds to the value of the LotNumber field under the ConsumableInfo field for SampleTube Type.
Run End Time	`RunCompletionStatus.xml`	RunEndTime	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Name	`RunParameters.xml`	ExperimentName	Visible on Record Details screen.

Table 36 Other Clarity LIMS Master Step Fields

Field Name	Value	Additional Information
Run Status	Presets • RunStarted • RunCompletedSuccessfully • RunAbortedByUser • RunErroredOut Set by the SIS integration service.	Visible on Record Details screen.

Field Name	Value	Additional Information
Sequencing Log	Set by the SIS integration service during the sequencing run.	Visible on Record Details screen.
BaseSpace Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
ICA Project ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Instrument Run ID	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.
Run Start Time	Received from the SQS message in the SIS integration service.	Hidden Do not remove, rename, or modify this field as it can cause the integration to break.

Global Fields

The following global custom fields are used to capture the run metrics in Clarity LIMS:

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2

- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % PrePhasing R1
- % PrePhasing R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

At the end of the step, the pools of samples are automatically removed from the step. The step completes automatically when Run Status is RunCompletedSuccessfully.

How the Integration Works

The following information summarizes how the NovaSeq X Series integration works.

- After the Validate Run Setup and Create Planned Run automation is triggered on the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step, the run parameters entered in the Run Details screen are sent to ICA. The analysis configuration parameters from the selected ACTs are also sent to ICA. ICA validates the run and analysis configuration. If the validation fails, ICA sends an error message to Clarity LIMS. If the validation passes, ICA generates the sample sheet and sends it back to Clarity LIMS. ICA also creates the planned run based on the selected run mode (eg, Local or Cloud).
  - For the Local run mode, the sample sheet is generated and stored in Clarity LIMS. This sample sheet contains the run and analysis configuration information required to start the run on the NovaSeq X Series instrument.
  - For the Cloud run mode, the planned run is created in ICA. The planned run contains the run and analysis configuration information required to start the run on the instrument. The sample sheet is generated and stored in Clarity LIMS for reference purposes.
- When the sequencing run starts on the instrument, the NovaSeq X Series Control Software notifies BaseSpace Sequence Hub. BaseSpace Sequence Hub monitors the run and uses the Stratus Integration Service (SIS) to notify Clarity LIMS. The events are processed and the integration service retrieves the run information from BaseSpace Sequence Hub. This information is used to populate the custom fields in the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.

For Research Use Only. Not for use in diagnostic procedures.

- Other run events follow the same information flow. When sequencing is complete, the control software uploads the sequencing run data (primary metrics) and associated files to ICA. Then, Clarity LIMS retrieves the primary metrics and uses them to populate the fields in the Sample Details table (eg, % Error Rate R1). The custom fields (eg, Run Status, Current Read, and so on) on the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step are updated using the run related information. If the sequencing run is successfully completed, the step automatically completes.
- The analysis results are not tracked. You must log in to BaseSpace Sequence Hub to retrieve the cloud analysis results. For local analysis, the secondary analysis results are found in the external storage configured in Illumina Run Manager. You can find this storage information under External Storage and Analysis Results.

NovaSeq X Series Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq X Series instrument.

Run Mode Configuration

1. In the NovaSeq X Series Control Software, log in to the instrument using an account that has permissions for configuring settings.
2. From the menu, select Settings.
3. From Settings, select Cloud settings.
4. Under Run Settings, select the checkbox next to Cloud run storage.
5. For Hosting location, select the applicable location from the drop-down options.
6. [Optional] For Private domain name, enter the domain name according to the workgroup that was configured with the NovaSeq X Series integration package.
7. Select Save.

Start a Sequencing Run in Local Run or Cloud Modes

1. You can start the sequencing run in BaseSpace Sequence Hub for both the Local and BaseSpace (Cloud) modes. Make sure that you log in using the account that was used during the NovaSeq X Series integration package setup. For more information, refer to the BaseSpace Sequence Hub Online Help at help.basespace.illumina.com.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Reagent Kits

- Buffer Cartridge

- Lyophilization Cartridge
- NaOH
- Reagent Cartridge
- Resuspension Buffer (RSB)
- TT2

Container Types

- Library 8-Tube Strip
- Tube

This integration supports the library 8-tube strip with the barcode in the LC[0-9]{7}-LC1 format (eg, LC1234567-LC1).

Control Types

- PhiX v3

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- All submitted samples must have an associated secondary analysis that is configured using the analysis configuration template (ACT). The ACT must be configured on BaseSpace Sequence Hub before starting the Assign Analysis Configuration Template step.
- The library tube strip barcode must be unique. There must not be multiple library tube strip containers with the same name in the system.
- Reagent labels, or indexes, must be unique.
- One library pool can only contain one library or control with no label/index.
- The AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step must not be manually started or completed. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, you must select Validate Run Setup and Create Planned Run in the Load to Library Tube step.

NovaSeq X Series Integration v1.0 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq X Series Integration Package v1.0.

The validation process involves the following actions:

- Running samples through the Library Prep Validation v2.3.0 workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce libraries tagged with index sequences. At the end of the step, these libraries are routed to NovaSeq X Series Sequencing v1.0 workflow.
- Running libraries through the NovaSeq X Series Sequencing v1.0 workflow validates the following items:
  - Successful sequential step advancement of samples through the steps of the workflow.
  - Automatic validation of run setup information before sample sheet generation or planned run creation.
  - Automated sample sheet generation. This sample sheet is used to start the sequencing run on the NovaSeq X Series Control Software through the Local run mode.
  - Automated creation of a planned run in Illumina Connected Analytics (ICA). The control software retrieves the planned run. The run is started through the Cloud run mode.
  - Automated tracking of the NovaSeq X Series sequencing run and parsing of run statistics into Clarity LIMS.

The validation steps assume that the following conditions have been met:

- NovaSeq X Series Integration Package v1.0 is installed and you have imported the default Clarity LIMS configuration.
- Analysis configuration templates (ACTs) are created in BaseSpace Sequence Hub for your run. Make sure that the index adapter kit label group is created in Clarity LIMS before selecting it in the ACT. This same label group is used in the Run Library Prep Validation v2.3.0 step. For more information on creating a reagent label group, refer to *Add and Configure Labels and Label Groups* in the Clarity LIMS Core Documentation. For the adapter sequences for your library prep kits, refer to *Illumina Adapter Sequences*.

Analysis Configuration Template Creation in BaseSpace Sequence Hub

You must create the analysis configuration templates (ACTs) that are required for configuring secondary analysis in the NovaSeq X Series Sequencing v1.0 workflows. Create ACTs in BaseSpace Sequence Hub. For instructions, refer to the BaseSpace Sequence Hub online help.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v2.3.0 and NovaSeq X Series Sequencing v1.0 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.3.0 and NovaSeq X Series Sequencing v1.0 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.

   Only use alphanumeric, dash, or underscore characters in the submitted sample names. Invalid characters can cause a sample sheet validation failure in the Load to Library Tube Strip step.

3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.0

This single-step protocol models the library prep required to produce libraries tagged with index sequences that are ready for the NovaSeq X Series Sequencing v1.0 workflow.

Run Library Prep Validation v2.3.0

1. In Lab View, locate the Library Prep Validation v2.3.0 protocol.
   Samples are queued for the Library Prep Validation v2.3.0 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, under Label Options, select the label groups that you want to use.
   The label group, or index adapter kit, selected must be the same as the Index Adapter Kit selected in the ACT that is being used.
4. Select Begin Work.
5. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
6. On the Add Labels screen, the Labels to Add list contains labels from the label group selected in step 3 (eg, TruSeq HT Adapters v2 (D7-D5)). TruSeq HT Adapters v2 (D7-D5) is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
7. On the Record Details screen, complete the following actions:

For Research Use Only. Not for use in diagnostic procedures.

a. In the Sample Details table, enter values for Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.

> The Molarity (nM) values are used in the Calculate Volume automation script in the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step. If these values are not entered, the automation script does not work properly.

b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq X Series.

c. Populate the fields in the Sequencing Instrument column using one of the following methods:

- To populate fields individually for each sample, select from the drop-down list in each row.
- To populate all fields at one time, copy and paste from a spreadsheet.
- Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq X Series from the adjacent drop-down list. Select Apply.

> If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.

b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.

c. In the spreadsheet, enter the Molarity (nM) and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

8. Select Next Steps.
   This selection triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
9. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   > Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

10. Select Finish Step.
    On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq X Series Sequencing v1.0 workflow, Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0).

Protocol: NovaSeq X Series Sequencing v1.0

The NovaSeq X Series Sequencing v1.0 protocol consists of the following steps:

- Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)
- Make Bulk Pool (NovaSeq X Series Sequencing v1.0)
- Dilute and Denature (NovaSeq X Series Sequencing v1.0)
- Load To Library Tube Strip (NovaSeq X Series Sequencing v1.0)
- AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

Each step contains a script to register the start time (upon step entry) and the time that the step is completed (upon step exit). This information is published to Clarity LIMS Product Analytics through the Link service. These scripts are used only for Clarity LIMS Product Analytics support and can be incorporated as part of an automation that performs other functions.

Step 1: Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The samples are queued for the Assign Analysis Configuration Template (NovaSeq X Series Sequencing v1.0) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work to start the Validate Sample Names and Retrieve Analysis Configuration Template List and Register Step Started automation.
   The automation checks that the sample names do not use restricted characters and are within character limits and retrieves the list of ACTs that you can select. The automation also registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service. The part of the script for start time registration is used only for Clarity LIMS Product Analytics support.
4. Select the applicable ACT to assign to the samples. The index adapter kit specified by the ACT must correspond with the label group used in *Library Prep Protocol: Library Prep Validation v2.3.0* on page 130.
5. [Optional] Under Step Details, select Retrieve ACT Information to trigger the Retrieve ACT Information automation.
   This automation retrieves ACT information (eg, Library Prep Kit, Index Adapter Kit, Reference Genome, and so on) and populates the fields in Clarity LIMS. These details are saved to the `ACTMetadata.csv` file that you can download. If you are not sure of the analysis configuration before starting the sequencing and analysis run, refer to the details in the file.
6. Select Next Steps to assign the ACT to the samples.

This action triggers the Validate Reagent Labels and Apply Selected ACT to Samples and Set Next Step automation. This automation validates that the indexes applied to the libraries are valid for the selected ACT and assigns samples to it. All samples added to the Ice Bucket in step 2 are assigned to this ACT.

7. Select Finish Step.

To use multiple ACTs in a single run, repeat steps 2–7 for each ACT. For step 2, only add samples that are being assigned to that ACT into the Ice Bucket.

Step 2: Make Bulk Pool (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The samples are queued for the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
   You can also add control samples by selecting them from the Available control samples drop-down list and selecting Add.
3. On the Ice Bucket screen, select Begin Work.
4. Create a pool of samples as follows.
   a. On the Pooling screen, create a pool by dragging samples into the Pool Creator.
      If a control sample was added, it appears under the Sample List and can be pulled into the pool that needs the control.
   b. Enter a name for your pool or accept the default name (Pool #1).
   c. [Optional] If multiple pools are required, select the plus sign (+) next to Pool Creator to create a pool.
   d. [Optional] To remove a pool, select the X in the top right corner of the pool.
   e. Select Record Details to trigger the Validate Analysis Configurations automation.
      This automation performs the following checks on the analysis configuration for each pool:
      - Pooled samples are within the maximum configuration limit.
      - Pooled samples have the sample type of analysis (Cloud or Local).
      - Pooled samples that have the same secondary analysis also have the same analysis version.
      - Pooled samples that have the same secondary analysis also have the same analysis settings.
5. On the Record Details screen, navigate to the Reagent Lot Tracking section to track the Universal Buffer (UNB) lot information used in the step.
6. [Optional] Create a new lot. For more information, refer to *Add and Configure Reagent Kits and Lots* in the Clarity LIMS LIMS Core Functionality documentation.
7. In the Step Details area, complete the following required fields:

For Research Use Only. Not for use in diagnostic procedures.

- Number of Lanes to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced. This field is applied to all pools in the step. If a pool requires a different value for this field, then repeat the Make Bulk Pool (NovaSeq X Series Sequencing v1.0) step.
- Final Loading Concentration (pM)—The final loading concentration of the pool in the flow cell. This field value is typically dependent on the library type.
- Final Loading Volume (µl)—The final loading volume of the pool in the flow cell. This field is prepopulated with the configured default value (200 µl), but can be edited if more volume is required.
- Minimum Per Sample Volume (µl)—The minimum volume for each sample. This field is prepopulated with the configured default value (2 µl) and can be edited. If the per sample volume is below the value set in this field, the Calculate Volumes script applies a rounding factor to affected samples so that the volume reaches the minimum volume.

8. Select Calculate Volumes to trigger the Calculate Volumes automation.
   This automation calculates the volumes required for each library to form a pool that has the concentration and volume specified in the Step Details field. This automation is applied to control samples when they are indexed and molarity is specified. It also generates the Calculation File in a CSV format and attaches it to the step. You can select the file name to download it.
9. In the Sample Details table, select the pool next to the sample name to view details on the pool composition.
10. Select Next Steps to trigger the Set Next Step automation.
    This automation sets the next step for samples to ADVANCE, which moves them to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.
11. On the Assign Next Steps screen, make sure that the samples are set to the Dilute and Denature (NovaSeq X Series Sequencing v1.0) step.
12. Select Finish Step.

Step 3: Dilute and Denature (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The pool of samples queued for the Dilute and Denature (NovaSeq X Series Sequencing v1.0) displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
   - On entry to the step, the Validate Inputs Flowcell Type and Register Step Started automation is triggered. This automation makes sure that the configured flow cell type is valid. The automation also registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service. The portion of the script used for start time registration is used only for Clarity LIMS Product Analytics support.

For Research Use Only. Not for use in diagnostic procedures.

- On entry to the Record Details screen, the Calculate Volumes automation is triggered.
  This automation sets the following values:
  - BP Aliquot Volume (µl)
  - RSB Volume (µl)
  - NaOH Volume (µl)
  - TT2 Volume (µl)
  - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the volume of RSB, NaOH, and TT2 to add per working pool.

4. On the Record Details screen, the Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and TT2 reagents used in the step. To add and activate reagent lots, do as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select one of the reagent kits previously listed (eg, NaOH) and select New Lot.
   d. Enter the lot details.
   e. Select Save.
   f. Set the Status of Reagent Lot toggle switch to Active.
   g. Repeat this process to add and activate the remaining reagent lots.
   h. Return to your original working browser tab and refresh the page.
5. On the Record Details screen, perform the following actions:
   a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   b. In the Sample Details table, make sure that the BP aliquot, RSB, NaOH, and TT2 reagent volume values are populated. The script sets these values and they cannot be edited.
   c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.
      The working pool number is appended to the bulk pool name so that you can identify which working pools are derived from the same bulk pool.
6. In the Files area, select the Calculation File (CSV) to open it and view details on the RSB, NaOH, and TT2 volumes to add per working pool.
7. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0).
8. Select Finish Step.

Step 4: Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0)

1. In Lab View, locate the NovaSeq X Series Sequencing v1.0 protocol. The pool of samples are queued for the Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) step.

2. Add the pools to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work to trigger the Validate Analysis Configurations and Register Step Started automation.
   This automation performs the following basic checks on the analysis configuration for each pool:
   - Pooled samples are within the maximum configuration limit.
   - Pooled samples have the sample type of analysis (Cloud or Local).
   - Pooled samples that have the same secondary analysis alsohave the same analysis version.
   - Pooled samples that have the same secondary analysis also have the same analysis settings.

   The automation also registers the start time of the step by publishing messages to Clarity LIMS Product Analytics through the LINK service. The portion of the script used for start time registration is used only for Clarity LIMS Product Analytics support.
4. On the Placement screen, do as follows.
   a. Drag the pool into the Library 8-tube Strip in the Placed Samples area on the right.
   b. Scan or type the barcode of the Library 8-tube Strip into the Library 8-tube Strip container name field.
   c. Select Record Details.

   After exiting the Placement screen, the Validate Library Strip Tube Barcode automation makes sure that the library tube strip barcode conforms to the barcode mask LC[0-9]{7}-LC1.
5. The fields displayed on the Record Details screen are used to create the planned run and generate the sample sheet.
   The analysis related information for the planned run is from the ACT associated with the samples and no further analysis configuration is required. Refer to the following table for details.

Table 37 Fields Displayed on Record Details Screen of Load to Library Tube Strip (NovaSeq X Series Sequencing v1.0) Step

Field	Value
Run Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
Run Mode	The selected Run Mode must correspond to the ACT type. Presets • Local[1] • Cloud[2]
Read 1 Cycles	Presets • 151 • 101 • 51 • Type a custom value

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 2 Cycles	Presets • 151 • 101 • 51 • Type a custom value
Index 1 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]
Index 2 Cycles	Presets • 0 • 6 • 8 • Type a custom value[3]

[1] The Local run mode generates the sample sheet. The Run/Analysis configuration is imported manually to the NovaSeq X Series instrument through the sample sheet. The mode uses EdgeOS (on the instrument or computer) to start the run. The downstream secondary analysis is done using the onboard DRAGEN module.
[2] The Cloud run mode sends the Run/Analysis configuration to ICA. This configuration is downloaded to the NovaSeq X Series instrument through ICA to start the run. The downstream secondary analysis is done in the cloud.
[3] The custom value must correspond to the longest index sequence of the samples in the pools in the library tube strip. Otherwise, the planned run creation fails and an error message displays.

6. Select Validate Run Setup and Create Planned Run to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Creates the planned run and sends it to ICA when the Run Mode is Cloud.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen for all Run Mode types.
7. Select Next Steps.
   On the Assign Next Steps screen, the next step for the pooled samples is set to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step.
8. Select Finish Step to advance the pooled samples to the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step. For more information on how to start the sequencing run for different run modes, refer to *NovaSeq X Series Integration v1.0 Configuration and User Interaction* on page 99.

Step 5: AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0)

This protocol contains the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step. This step is fully automated.

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics in the Step Details section and the Sample Details table.

Step Details Section

The following values populate the master step fields:

- Run Name
- Run Status
- Output Folder
- Current Read
- Current Cycle
- Library Tube Barcode
- Flow Cell ID
- Flow Cell Side
- Flow Cell Type
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Sequencing Log

Sample Details Table

Summary metrics populate the following global custom fields:

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2

- Yield (Gb) R1
- Yield (Gb) R2
- Reads PF R1
- Reads PF R2
- %PF R1
- %PF R2
- % Aligned R1
- % Aligned R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Cluster Density R1
- Cluster Density R2

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the *Troubleshooting Automation* section in the Clarity LIMS API & Database documentation.

Automated Step Does Not Start

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step does not start, Clarity LIMS is likely not receiving sequencing run events from BaseSpace Sequence Hub correctly. Check for the following issues:

1. Make sure that Illumina Run Manager is configured properly as follows.
   a. Before you start the run, in Illumina Run Manager, select the appropriate BaseSpace Sequence Hub region in the Hosting location drop-down list.
   b. Under Run Settings, check the boxes next to Cloud run monitoring and Cloud run storage.
2. Make sure that the BaseSpace Sequence Hub code feature StratusRegionalEventsDisabled is turned off for the BaseSpace Sequence Hub region. If the feature is on, contact Illumina Support to turn it off. Make sure that the correct BaseSpace Sequence Hub region is selected.

Automated Step Starts, But Does Not Complete

If the AUTOMATED - Sequencing Run (NovaSeq X Series Sequencing v1.0) step starts, but does not complete, do as follows.

1. Log in to the default user account and use one of the following methods to open the in progress step in Clarity LIMS:
   a. In Lab View, find the step in the Recent Activities pane.
   b. Search for the step in Clarity LIMS using the library tube strip barcode as the search term.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Validate Analysis Configuration Automation Check Fails

The Validate Analysis Configuration automation check is in the Make Bulk Pool (upon pooling) and Load to Library Tube Strip (upon step entry) steps. If a failure happens, an error message displays and the step can be aborted, or you might be prevented from continuing the step. This check can fail for the following reasons:

- The analysis configuration after library pooling or during the planned run creation exceeds the configuration limit. Resolve this error as follows.
  - If the error occurs on the Make Bulk Pool step, reduce the number of analysis configurations for a pool. To reduce the number, reorganize the samples for the pooling step (eg, by pooling samples that have similar configurations together).
  - If the error occurs on the Load to Library Tube step, reduce the number of analysis configurations for the planned run by reorganizing the samples for multiple runs instead of a single run.
- ACTs of samples in the same pool or planned run must have the same run mode (Local or Cloud). Resolve this error as follows.
  1. Abort the step and remove samples with ACTs that have conflicting run modes from the Ice Bucket.
  2. Make sure that all remaining samples in the Ice Bucket have ACTs with the same run modes.
  3. Select Begin Work to continue the step.
- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis version. Resolve this error as follows.
  - If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different pools.

  - If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis versions, are in different runs.

- ACTs of samples in the same pool or planned run that have the same secondary analysis must have the same analysis settings. The analysis setting fields can differ for a different secondary analysis and are configured in BaseSpace Sequence Hub when the ACT is created. Resolve this error as follows.
  1. If the error occurs on the Make Bulk Pool step, pool the samples again. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different pools.
  2. If the error occurs on the Load to Library Tube step, reorganize the samples for the planned run. Make sure that samples with the same secondary analysis, but conflicting analysis settings, are in different runs.

NovaSeq X Series Integration v1.0 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeq X Series Integration Package version 1.0.

Compatibility

This version of the integration package is compatible with the following software:

- BaseSpace Clarity LIMS v5.3 and later
- NGS Extensions Package v5.22 and later
- Illumina Preset Protocols (IPP) v2.5.0 and later
- NovaSeq X Series Operating Software v1.0.0

New Features

Features provided with this release of the integration package are as follows.

- Provides integration between the NovaSeq X Series instrument and Clarity LIMS.
- Supports Local and Cloud run modes with automated tracking of the sequencing run and parsing of run statistics to Clarity LIMS.
- Supports the configuration of multiple secondary analyses on a sequencing run with the Analysis Configuration Template (ACT). This template can be configured using BaseSpace Sequence Hub.
- Generates the v2 sample sheet.
- Delivers the NovaSeq X Series Sequencing v1.0 workflow directly from IPP v2.5.

Defects Fixed

None

Known Limitations

- This integration does not track the analysis step. You must log in to BaseSpace Sequence Hub to view the cloud analysis status and results. For local analysis, the secondary analysis results are located in the external storage configured in Illumina Run Manager.
- The Local run mode does not support custom library prep and index adapter kits.

Known Issues

- On the Make Bulk Pool step, the log displays a warning when the Calculate Volume automation is triggered and at least one pool consists of multiple inputs. This issue is caused by the output custom field being reset multiple times at the end of the automation. This issue does not affect the volume calculation.

NovaSeq 6000Dx Integration

The Illumina NovaSeq 6000Dx integration provides preconfigured workflows that map to established lab protocols and steps used with NovaSeq 6000Dx sequencing instruments. The integration also supports the associated library prep kits, reagent kits, and assays used in these protocols.

NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction

Illumina NovaSeqDx Integration Package v1.2 supports the integration of Clarity LIMS to Illumina NovaSeq 6000Dx instruments.

For instructions on validating and troubleshooting Illumina NovaSeqDx Integration Package v1.2, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

> The configuration provided in this integration has been established to support NovaSeq 6000Dx lab processes. Any configuration changes to protocols or workflows—including renaming protocols, steps, and fields—could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeqDx v1.2 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeqDx v1.2)
  - NovaSeqDx Standard (NovaSeqDx v1.2) (supports the loading of pooled libraries into a library tube)
  - NovaSeqDx Xp (NovaSeqDx v1.2) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)
- Automated generation of v2 sample sheet. This file is automatically uploaded to the instrument via the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeqDx sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)

- Sequencing run parameters
- Sequencing run data directory location
- Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.1 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.2 workflow. For more information, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59. The Library Prep Validation v2.3.1 workflow is available in the Illumina Preset Protocols (IPP) v2.6 package.

Prerequisites and Assumptions

Samples enter the NovaSeqDx v1.2 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to the following sections of the Getting Started section of the Clarity LIMS Core Functionality documentation:

- *Sample Accessioning*
- *Using Sample Lists to Upload and Modify Samples*

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000Dx Integration Package v1.2 includes the following workflows:

- NovaSeqDx v1.2
- Library Prep Validation v2.3.1 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 38 NovaSeq 6000Dx Integration Package v1.2 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.1 Workflow		

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.1	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeqDx v1.2) protocol. The protocol contains a single step - Library Prep Validation v2.3.1. After this step, a routing script sends the samples to the first step of the NovaSeqDx v1.2 workflow - Define Run Format (NovaSeqDx v1.2).	1. Library Prep Validation v2.3.1
	NovaSeqDx v1.2 Workflow	
Run Format (NovaSeqDx v1.2)	Allows for the assignment of per sample values for the following properties: • NovaSeqDx Run Mode: Select either RUO or DX. • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity (nM): Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Validates user selection on NovaSeqDx Run Mode, Loading Workflow Type and Flowcell Type. Routing script sends samples to the NovaSeqDx Standard or NovaSeqDx Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeqDx v1.2)

For Research Use Only. Not for use in diagnostic procedures.

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeqDx Standard (NovaSeqDx v1.2)	Samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) protocol.	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) 2. Dilute and Denature (NovaSeqDx v1.2)
NovaSeqDx Xp (NovaSeqDx v1.2)	Samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.2) step determines the flow cell type. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) protocol.	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) 2. Dilute, Denature & ExAmp (NovaSeqDx v1.2) 3. Load to Flowcell (NovaSeqDx v1.2)
AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)

Validation Workflow

The Library Prep Validation v2.3.1 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Step Automations

The following table lists the step automations included in the NovaSeqDx v1.2 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Table 39 NovaSeq 6000Dx v1.2 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeqDx v1.2)	1. Define Run Format (NovaSeqDx v1.2)	Routing Script Set Next Steps
2. NovaSeqDx Standard (NovaSeqDx v1.2)	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Single NovaSeqDx Run Mode Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute and Denature (NovaSeqDx v1.2)	Routing Script Validate Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeqDx Xp (NovaSeqDx v1.2)	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute, Denature & ExAmp (NovaSeqDx v1.2)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeqDx v1.2)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)	Update Lane Number Set Next Steps (Not used. By default, the Sequencer API determines this functionality. If necessary, you can enable the automation and use it to override the next step behavior used by the Sequencer API.)

Protocol 1: Run Format (NovaSeqDx v1.2)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeqDx Standard (NovaSeqDx v1.2) or the NovaSeqDx Xp (NovaSeqDx v1.2) protocol.

This protocol contains one step: Define Run Format (NovaSeqDx v1.2).

Step 1. Define Run Format (NovaSeqDx v1.2)

Step input: Normalized Template Plate (NTP, normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Checks NovaSeqDx Run Mode, Loading Workflow Type, and Flowcell Type. Only the NovaSeq Standard with the S2/S4 flow cell is supported for the NovaSeqDx Run Mode:

```
if (input.::NovaSeqDx Run Mode:: == ::DX::) {
    if (input.::Loading Workflow Type:: == ::NovaSeq Xp::) {
        fail(::Invalid option selected. NovaSeq Standard shall be selected for DX
        mode.::);
    };
    if (input.::Flowcell Type:: == ::SP:: || input.::Flowcell Type:: == ::S1::) {
        fail(::Invalid option selected. Only S2 or S4 flowcell shall be selected
        for DX mode.::);
    };
};
```

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the Minimum Molarity with the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares the Normalized Molarity value of each sample with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, this sets the Loading Workflow Type of the sample to [Remove from workflow]. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
    input.::Warning:: = ::The Normalized Molarity is too low.::;
    input.::Loading Workflow Type:: = ::[Remove from workflow]::;
} else {
    input.::Warning:: = ::n/a::
}
```

At this point, the following options are available:

- Correct the NovaSeqDx Run Mode and Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeqDx v1.2 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeqDx v1.2 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step.

Default automation command line is as follows.

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
```

```
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeqDx v1.2' \
--STEP 'Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \
--WORKFLOW 'NovaSeqDx v1.2' \
--STEP 'Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Master Step Fields

There are four fields defined on the Define Run Format (NovaSeqDx v1.2) master step.

The following table lists field configuration details.

Table 40 Define Run Format (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text		None
Flowcell Type	Text Dropdown	Required Field Custom Entries	Presets • SP • S1 • S2 • S4
Instruction	Text	Read Only	Default • Add Flowcell Type, Loading Workflow Type, and NovaSeqDx Run Mode
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeqDx v1.2) step.

Table 41 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Presets • 225 • 400 Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
NovaSeqDx Run Mode	Text Dropdown	Required Field	Presets • DX • RUO
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Warning	Text Dropdown	Read Only Custom Entries	Presets • The Normalized Molarity (nM) is too low. • n/a

User Interaction

Refer to the Step 1: Define Run Format (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.2)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeqDx Run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) protocol.

This protocol contains the following two steps:

- Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)
- Step 2: Dilute and Denature (NovaSeqDx v1.2)

Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Single NovaSeqDx Run Mode Automation

The Validate Single NovaSeqDx Run Mode automation is triggered on entry of the step. The following automation checks that all input samples have the same NovaSeqDx Run Mode assigned:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
```

```
script:validate_same_analyte_udf_value_for_all_inputs \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-f 'NovaSeqDx Run Mode'"
```

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when you select the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
```

```
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, this automation completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field of the sample.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: +
input.::Adjusted Per Sample Volume (ul)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::
} ;
```

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value a calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type.

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S1:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
output.::Volume of Pool to Denature (ul):: = 150 ;
output.::NaOH Volume (ul):: = 37 ;
output.::Tris-HCl Volume (ul):: = 38
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
output.::Volume of Pool to Denature (ul):: = 310 ;
output.::NaOH Volume (ul):: = 77;
output.::Tris-HCl Volume (ul):: = 78
}
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download in the Files section of the Record Details milestone in the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
      Bulk_Pool1.csv \
      -o 1.csv \
   script:driver_file_generator \
```

```
    -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
    Bulk_Pool2.csv \
    -o 2.csv \
  script:driver_file_generator \
    -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
    Bulk_Pool3.csv \
    -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the Dilute and Denature (NovaSeqDx v1.2) step in the protocol:

```
nextStep = ::ADVANCE::
```

The following automation copies the NovaSeqDx Run Mode values from the step inputs to the step outputs:

```
output.::NovaSeqDx Run Mode:: = input.::NovaSeqDx Run Mode::
```

Master Step Fields

The following fields are defined on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step.

Table 42 Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step.

Table 43 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Volume of Pool to Denature (µl) (Used in Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step only. Displays on Record Details screen and in the generated CSV file.)	Numeric	Read Only	Decimal places displayed = 0

User Interaction

Refer to the Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Step 2: Dilute and Denature (NovaSeqDx v1.2)

In this step, the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB) denatures and dilutes pooled samples. Manually place the pooled samples into the library tube for the NovaSeqDx Run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the following barcode masks:
  - DX mode: DX[0-9]{7}-[A-Z]{3}
  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}

```
if ((input.::NovaSeqDx Run Mode:: == ::DX:: && !output.container.name.matches
(::^DX[0-9]{7}-[A-Z]{3}$::)) || (input.::NovaSeqDx Run Mode:: == ::RUO:: &&
!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::))) {
fail(::Invalid Library Tube Barcode. Please verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

Triggered by a button on the Record Details screen, this automation completes the following actions:

> The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit. If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. The parameters are as follows. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000Dx Run*.
  - Experiment Name only contains alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
```

```
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values as follows.
  - If Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - If Paired End = False, Read 2 Cycles must be zero.

```
if (step.::Paired End::.toBoolean()) {
   if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
      fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
      End is True.::)
   }
} else {
   if (step.::Read 2 Cycles:: != 0) {
      fail(::Read 2 Cycles must be 0 if Paired End is False.::)
   }
};
```

- Checks the Flowcell field value as follows.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
```

For Research Use Only. Not for use in diagnostic procedures.

```
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to contain only Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Generates the V2 sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation*.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeqDx v1.2 workflow, and queues them for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.

The default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid1}
script:changeWorkflow \
```

For Research Use Only. Not for use in diagnostic procedures.

```
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeqDx v1.2' \
--STEP 'AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

The following table lists field configuration details for the fields that are defined on the Dilute and Denature (NovaSeqDx v1.2) step. These fields are required for sample sheet and JSON file generation.

Table 44 Dilute and Denature (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Not Used Run Monitoring Only Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Output Folder	Text	Required Field	
Override Cycles	Text		

Field Name	Field Type	Options	Additional Options and Dropdown Items
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Read 2 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Run Mode (Not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if (step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
```

```
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) } }; if (input.::Flowcell Type:: != ::SP:: &&
step.::Read 1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: &&
step.::Read 2 Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (step.hasValue(::Analysis Software
Version::) && !step.::Analysis Software Version::.matches(::^(\\d+)
(\\.\\d+)*$::)) { fail(::Analysis Software Version contains prohibited
characters. Allowed characters are 0-9 and period. It shall start and end with
numbers and separated by single period e.g. 3.8.4::) }; if (step.hasValue
(::Override Cycles::) && !step.::Override Cycles::.matches(::[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::) }; nextStep =
::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeqDx v1.2) step.

Table 45 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to the Step 2: Dilute and Denature (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.2)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeqDx flow cell type selected in the Define Run Format (NovaSeqDx v1.2) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)
- Step 2: Dilute, Denature & ExAmp (NovaSeqDx v1.2)
- Step 3: Load to Flowcell (NovaSeqDx v1.2)

Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
```

```
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type:

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22;
step.::PhiX Volume (ul):: *= 0.8;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30;
step.::PhiX Volume (ul):: *= 1.1;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
    output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
    Sample Volume (ul)::
} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download in the Files segment of the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
    script:driver_file_generator \
        -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
        Pool.csv \
        -o {compoundOutputFileLuid0}.csv \
    script:driver_file_generator \
```

```
        -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
        Pool2.csv \
        -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The fields in the following table are defined on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step.

Table 46 Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric		Range = 0– 100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (µl)	Numeric	Required Field	Default • 5 Decimal places displayed = 2
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step.

Table 47 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to the Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting*.

Step 2: Dilute, Denature & ExAmp (NovaSeqDx v1.2)

In this step, the addition of DPX, NaOH, Tris-HCl, and RSB denatures and dilutes pooled samples. Manually create working pools based on the number of lanes that you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number (choose how many working pools to create per bulk pool)

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4). This automation also checks that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (µl):: = 18 ;
```

```
output.::NaOH Volume (µl):: = 4 ;
output.::Tris-HCl Volume (µl):: = 5 ;
step.::DPX1 Volume (µl):: = 126 ;
step.::DPX2 Volume (µl):: = 18 ;
step.::DPX3 Volume (µl):: = 66 ;
output.::Mastermix per Lane (µl):: = 63
};

if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4 ;
output.::Tris-HCl Volume (µl):: = 5 ;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5 ;
output.::Tris-HCl Volume (µl):: = 6 ;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7 ;
output.::Tris-HCl Volume (µl):: = 8 ;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
```

```
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. This file contains information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download in the Files segment of the Dilute, Denature & ExAmp (NovaSeqDx v1.2) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool.csv \
      -o {compoundOutputFileLuid0}.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool2.csv \
      -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists field configuration details for the fields that are defined on the Dilute, Denature & ExAmp (NovaSeqDx v1.2) step. A script sets these field values. They are not editable while running the step.

Table 48 Dilute, Denature & ExAmp (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature & ExAmp (NovaSeqDx v1.2) step.

Table 49 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	• Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

Refer to the Step 2: Dilute, Denature & ExAmp (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Step 3: Load to Flowcell (NovaSeqDx v1.2)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeqDx run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.

The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

For Research Use Only. Not for use in diagnostic procedures.

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-Z0-9]{5}DM[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Z0-9]{5}DS[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file.
  - Experiment Name only contains alphanumeric, dash, or underscore characters. Spaces are not permitted.

  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be 0.
  - When Workflow Type = Single Index, Index Read 1 must be greater than 0 and Index Read 2 must be 0.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than 0.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - When Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - When Paired End = False, Read 2 Cycles must be 0.

```
if (step.::Paired End::.toBoolean()) {
   if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
      fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
      End is True.::)
   }
} else {
   if (step.::Read 2 Cycles:: != 0) {
      fail(::Read 2 Cycles must be 0 if Paired End is False.::)
   }
};
```

- Checks the Flowcell field value.

For Research Use Only. Not for use in diagnostic procedures.

  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If the value is greater than 151, an error message displays.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validate Analysis Software Version

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Checks Override Cycles field value. This field contains only Y, N, I, U, 0–9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 45.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}
```

Master Step Fields

The following table lists the field configuration details for the fields defined on the Load to Flowcell (NovaSeqDx v1.2) step.

Table 50 Load to Flowcell (NovaSeqDx v1.2) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Presets • 0 • 6 • 8 Range = 0–20 Decimal places displayed = 0
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Presets • 0 • 6 • 8 Range = 0–20 Decimal places displayed = 0
Library Tube Barcode	Text	Required Field	
Output Folder	Text	Required Field	
Override Cycles	Text		

Field Name	Field Type	Options	Additional Options and Dropdown Items
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Presets • 251* • 151 • 101 • 51 Range = 1–251 Decimal places displayed = 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Presets • 251* • 151 • 101 • 51 Range = 0–251 Decimal places displayed = 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value provided in the drop-down section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited

(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::
[Settings]:: : ::::; nextStep = ::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeqDx v1.2) step.

Table 51 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Analyte in Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

For more information, refer to the Step 3: Load to Flowcell (NovaSeqDx v1.2) section in *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)

This final protocol contains one fully automated step, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2).

This step is fully automated. Do not add samples to the Ice Bucket or start the step manually. If steps are manually started, the sequencing service does not update the samples correctly.

Step 1: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)

Step input: Library tube from NovaSeqDx Standard or flow cell from NovaSeqDx Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq 6000Dx instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configure autoComplete Properties* on page 57.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following table shows the master step fields that are configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.

Table 52 Clarity LIMS Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Current Cycle	Numeric	Read Only	Decimal places displayed = 0
Current Read	Numeric	Read Only	Decimal places displayed = 0
Firmware Version	Text	Read Only	
Flow Cell Expiration Date	Date	Read Only	
Flow Cell ID	Text	Read Only	
Flow Cell Lot Number	Text	Read Only	
Flow Cell Mode	Text	Read Only	
Flow Cell Part Number	Text	Read Only	
Flow Cell Side	Text	Read Only	
Instrument Control Software Version	Text	Read Only	
Instrument ID	Text	Read Only	
Instrument Type	Text	Read Only	
Lane Counter	Numeric	Read Only	Default • 1 Hidden
Loading Workflow Type	Text	Read Only	
Output Folder	Text	Read Only	
RTA Version	Text	Read Only	

Field Name	Field Type	Options	Additional Options and Dropdown Items
Run Completion Date	Text	Read Only	Hidden
Run ID	Text	Read Only	
Run Status	Text	Read Only	
Sequencing Log	Multiline Text	Read Only	

Global Fields

The following table shows the global custom fields that capture the run metrics in Clarity LIMS.

Table 53 Custom Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% Aligned R1	Numeric	Read Only	Decimal places displayed = 2
% Aligned R2	Numeric	Read Only	Decimal places displayed = 2
% Bases >=Q30 R1	Numeric	Read Only	Decimal places displayed = 2
% Bases >=Q30 R2	Numeric	Read Only	Decimal places displayed = 2
% Error Rate R1	Numeric	Read Only	Decimal places displayed = 2
% Error Rate R2	Numeric	Read Only	Decimal places displayed = 2
% Phasing R1	Numeric	Read Only	Decimal places displayed = 3
% Phasing R2	Numeric	Read Only	Decimal places displayed = 3
% Prephasing R1	Numeric	Read Only	Decimal places displayed = 3
% Prephasing R2	Numeric	Read Only	Decimal places displayed = 3

Field Name	Field Type	Options	Additional Options and Dropdown Items
%PF R1	Numeric	Read Only	Decimal places displayed = 2
%PF R2	Numeric	Read Only	Decimal places displayed = 2
Cluster Density (K/mm^2) R1	Numeric	Read Only	
Cluster Density (K/mm^2) R2	Numeric	Read Only	
Intensity Cycle 1 R1	Numeric	Read Only	
Intensity Cycle 1 R2	Numeric	Read Only	
Reads PF (M) R1	Numeric	Read Only	Decimal places displayed = 2
Reads PF (M) R2	Numeric	Read Only	Decimal places displayed = 2
Yield PF (Gb) R1	Numeric	Read Only	Decimal places displayed = 2
Yield PF (Gb) R2	Numeric	Read Only	Decimal places displayed = 2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeqDx v1.2 configuration provided in the Illumina Preset Protocols (IPP) Package v2.6 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If field names are changed in Clarity LIMS, they must also be changed through the run.metricUdfNames properties file in the `application.yml` file for the Sequencer API. All fields are configured to be visible on the Record Details screen for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step (in the Sample Details table). For more information, refer to the *application.yml Properties* section of *Components Installed* on page 51.

These global custom fields are configured on the Container entity, visible on each input, and must not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq 6000Dx Operating Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run. This step is either Dilute and Denature (NovaSeqDx v1.2) in the NovaSeqDx Standard protocol or Load to Flowcell (NovaSeqDx v1.2) in the NovaSeqDx Xp protocol. This step places samples on the library tube or flow cell that is loaded in the NovaSeq 6000Dx instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one sample sheet file for use with bcl2fastq v2.20 downstream analysis. This file is in the comma-separated values (CSV) format.

The sample sheet is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq 6000Dx.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The following step custom fields that display in the Step Details area of the Record Details screen control the sample sheet content:

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Index 1 Cycles
- Index 2 Cycles
- Analysis Software Version
- Override Cycles

For detailed information on the following items, refer to the bcl2fastq2 *Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 and later)*.

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000Dx Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000Dx instrument.

User Authentication and Login

User authentication and login to the NovaSeq 6000Dx instrument is achieved with the getSequencerLoginURL endpoint (`/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq 6000Dx Operating Software (NVOS) with a URL for the Clarity LIMS login screen. The NVOS displays this screen to the user. Log in to authorize NVOS to use your account to access Clarity LIMS. This authorization is automatic.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact Clarity LIMS at `http://localhost:9080/clarity/`. The installation script sets the URL, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed*.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by redirecting to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeqDx to continue with run setup.
   - If authentication fails, the login screen does not change and a warning message displays. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000Dx of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The sequencing-run/recipe/NovaSeqDx endpoint consumes a POST request with a LibraryContainerId, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagents are provided by the NovaSeq 6000Dx.
   - LibraryContainerId and FlowCellId can match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.

- All samples in the container must be queued for a sequencing run step.
- All samples must be queued for only one sequencing run step.
- All samples must be queued for the same sequencing run step.

> Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed*.

3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVOS via the API. Then, the run receipt is generated.
   Note the following details:
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeqDx v1.2) or Load to Flowcell (NovaSeqDx v1.2) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq 6000Dx v1.2 configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each property corresponds to an entry in the recipe. The value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step is configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. If no matching output is found, or no file was attached to the output, the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe. For more information, refer to the *application.yml Properties* section of *Components Installed*.
4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The sample sheet contents and the fields configured on the Dilute and Denature (NovaSeqDx v1.2) and Load to Flowcell (NovaSeqDx v1.2) steps control the contents of the run recipe.

Example of run recipe content is as follows.

```
{
```

```
"run_name": "NVOS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found, or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.

- If any kits enabled on the step are not configured for the Sequencer API, a warning is logged, and the API cannot complete the step without user intervention.
- If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored, and a warning is logged during lot tracking.

3. The type of flow cell being used in the run determines the number of replicates for the step.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged, and the reagent is ignored.
   - You can look up existing reagent lots by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and step 2.
   - Name—Serial number in request.
   - Lot Number—Lot number in request.
   - Expiry—Expiry date in request.
   - Status—Active.

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.
6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 49.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 49.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Finds the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the user ends a sequencing run, the API call for Sequencing RunEndedByUser is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000Dx Integration v1.2 is distributed as an RPM package, BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- The following configuration scripts:
  - `configure_sequencer_api_proxy.sh`
  - `configure_sequencer_api_env.sh`
  - `configure_sequencer_api_application.sh`

The NovaSeq 6000Dx v1.2 configuration is delivered through the Illumina Preset Protocols (IPP) Package v2.6. IPP Package v2.6 requires installation of NGS Extensions Package v5.23.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.23.0 is installed, the latest version is installed by default with the NovaSeq 6000Dx integration. For details, refer to *NovaSeq 6000Dx Integration v1.2 Release Notes* on page 89.
- If NGS Extensions Package v5.23.0 or later is already installed, upgrade is not forced or required.

NovaSeq 6000Dx Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for Sequencer API.
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMS Tomcat configuration to include Secret Util settings.

Files Installed	Location and Description
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with Clarity LIMS.

`application.yml` Properties

The `application.yml` file is at `opt/gls/clarity/extensions/sequencing-api/`.

- All properties are configured automatically during installation. You can also configure properties after installation, by editing the `application.yml` file. If you make changes to the file, you must restart Tomcat.
- File properties represent all custom field names, both for recipe and run information.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, the Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 54 `application.yml` Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (configure_ sequencer_api_application) prompts for this property.
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that is used when signing/validating OAuth tokens. Changing this property invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88

Property	Description
novaseq.sequenceStepNames	List of NovaSeq 6000Dx sequencing run step names for which the integration can find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line is indented to the same point and start with a dash (-). Default - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)

novaseq.flowcells	List of supported NovaSeq 6000Dx flow cell types.
	• Type names exactly match the values used by the NVOS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default value:
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4"`
	`lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	- lotName: The name of the lot as it appears in the run started request.
	- kitName: The name of the corresponding reagent kit in Clarity LIMS that is used for lot tracking.
	• The name can differ in the NVOS request versus the Clarity LIMS configuration.
	Default value:
	`- lotName: "Buffer"`
	`kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to *Run Recipe Contents* section in *NovaSeq 6000Dx Run* on page 46. • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

Property	Description
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section in *NovaSeq 6000Dx Run* on page 46 • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file global custom field names to be used when recording run results. These are the fields that capture the run data. For more information, refer to *Global Custom Fields* section.
run.autoComplete	Determines whether the sequencing run step is completed automatically after parsing the run metrics on a run (refer to run.autoCompleteOnlyAtSuccess). Default value: true For more information, refer to the *Configure autoComplete Properties* on page 57 section.
run.autoCompleteOnlyAtSuccess	Determines which of the following options are applicable to the sequencing run step: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true For more information, refer to the *Configure autoComplete Properties* on page 57 section.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris-HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the following formats:
  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}
    Example: AB1234567-LIB
  - DX mode: DX[0-9]{7}-[A-Z]{3}
    Example: DX1234567-LIB
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DR[A-Z0-9]{2}
  - S2 flow cell: [A-Z0-9]{5}DM[A-Z0-9]{2}
  - S4 flow cell: [A-Z0-9]{5}DS[A-Z0-9]{2}
    Example: H1991DMXX

NVOS Configuration

For details on configuring the NovaSeq 6000Dx Operating Software (NVOS) for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

- On the steps that use the routing script (Define Run Format (NovaSeqDx v1.2) and Dilute and Denature (NovaSeqDx v1.2)):
  - The Next Step for all samples must be set to Remove from workflow. A script sets this value. The value must not change in the Assign Next Steps screen.
- In the protocol configuration screen, the following settings are required and must not be changed:
  - In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.

Configure autoComplete Properties

The `application.yml` configuration file contains the following properties:

- run.autoCompleteOnlyAtSuccess
- run.autoComplete

These properties determine the conditions under which the last step of the NovaSeq 6000Dx workflow, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2), is automatically completed. The two scenarios for autocompletion of the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step are as follows.

- The step autocompletes only when the run status is RunCompletedSuccesfully (default behavior).
- The step autocompletes regardless of the run status.

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, the step must be completed manually in Clarity LIMS.

For the step to autocomplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enable/Disable autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccess property as required.
3. Save the file.

autoComplete Properties

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 55 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true	true	• Step automatically completes only if the sequencing run is successful. • If run is not successful, the step does not automatically complete, and the run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There must not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples. All other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)*.
- Do not manually start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, the Validate Run Setup and Generate Sample Sheet button must be selected.

NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeqDx Integration Package v1.2.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeqDx v1.2 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeqDx v1.2) step to the NovaSeqDx Standard (NovaSeqDx v1.2) or NovaSeqDx Xp (NovaSeqDx v1.2) step.
  - Automated generation of v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq 6000Dx sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the NovaSeqDx Integration Package v1.2 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v2.3.1 and NovaSeqDx v1.2 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.3.1 and NovaSeqDx v1.2 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.1

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.2 workflow.

Run Library Prep Validation v2.3.1

1. In Lab View, locate the Library Prep Validation v2.3.1 protocol.
   Samples are queued for the Library Prep Validation v2.3.1 step.

2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeqDx.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeqDx from the adjacent drop-down list. Select Apply.

   > If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.
   >
   > a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
   > b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
   > c. In the spreadsheet, enter the Molarity (nM) and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.
   > d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.
7. Select Next Steps.

Triggers the Set Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.

8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeqDx v1.2 workflow, Define Run Format (NovaSeqDx v1.2). This is the only step in Protocol 1: Run Format (NovaSeqDx v1.2).

Protocol 1: Run Format (NovaSeqDx v1.2)

This protocol includes a single step, Define Run Format (NovaSeqDx v1.2). The step allows for the assignment of per sample values for the following fields:

- NovaSeqDx Run Mode
- Loading Workflow Type
- Normalized Molarity
- Flowcell Type
- Final Loading Concentration (pM)

At the end of the step, samples are routed to the NovaSeqDx Standard or NovaSeqDx Xp protocol. This routing is done according to the selected Loading Workflow Type. The selected NovaSeqDx Run Mode must be compatible with the Loading Workflow Type and Flowcell Type. The following table shows the compatibility for the combinations of each Flowcell Type based on the NovaSeqDx Standard protocol.

Table 56 NovaSeqDx Standard Protocol Compatibility

Flowcell Type	Run Mode
SP	RUO
S1	RUO
S2	RUO, DX
S4	RUO, DX

The following table shows the compatibility for the combinations of each Flowcell Type based on the NovaSeqDx Xp protocol.

Table 57 NovaSeqDx Xp Protocol Compatibility

Flowcell Type	Run Mode
SP	RUO
S1	RUO
S2	RUO
S4	RUO

Step 1: Define Run Format (NovaSeqDx v1.2)

1. In Lab View, locate the Run Format (NovaSeqDx v1.2) protocol. The samples are queued for the Define Run Format (NovaSeqDx v1.2) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - NovaSeqDx Run Mode—Select DX or RUO.
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.
   - Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.
5. Select Next Steps, which triggers the Set Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Checks that the NovaSeqDx Run Mode value is compatible with the Loading Workflow Type and Flowcell Type. This automation also generates an error message if the Loading Workflow Type or the Flowcell Type are incompatible.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

> Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

- For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is recorded in the Warning field for the sample.
  To proceed, choose one of the following options:
  - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
  - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.

7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step. This step is the first step in the NovaSeqDx Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step. This step is the first step in the NovaSeqDx Xp protocol.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.2)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)
2. Dilute and Denature (NovaSeqDx v1.2)

Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2)

1. In Lab View, locate the NovaSeqDx Standard (NovaSeqDx v1.2) protocol.
   Samples for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
   When the step begins, the Validate Single NovaSeqDx Run Mode automation is triggered. This automation checks that the samples have the same NovaSeqDx Run Mode (RUO or DX).
4. On the Pooling screen, perform the following actions:

a. Create a pool by dragging samples into the Pool Creator.

> Only create one pool.

b. Enter a name for the pool or accept the default name (eg, Pool #1).

c. Select Record Details.
After exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation verifies the following items:

- All samples in the pool have been assigned the same Flowcell Type.
- Only one pool has been created.

5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:

- Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
- Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
- % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

> Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
>
> - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
> - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.

- Calculates Bulk Pool Volume (µl) value.
- Sets the value of the Bulk Pool Volume (µl) field.
- Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
- Calculates the Per Sample Volume (µl) value to be added to the pool.
- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, it calculates the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.

For Research Use Only. Not for use in diagnostic procedures.

- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples that it contains. Select the file to download it and then open it in Excel.

8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeqDx v1.2). The automation also copies the NovaSeqDx Run Mode value from the input pool to the output pool.
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeqDx v1.2).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeqDx v1.2) step.

Step 2: Dilute and Denature (NovaSeqDx v1.2)

1. In Lab View, locate the NovaSeqDx Standard (NovaSeqDx v1.2) protocol. The pool of samples queued for the Dilute and Denature (NovaSeqDx v1.2) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask that corresponds with the NovaSeqDx Run Mode in the following table. If the barcode does not match, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.

NovaSeqDx Run Mode	Valid Barcode Mask
RUO	[A-Z]{2}[0-9]{7}-[A-Z]{3}
DX	DX[0-9]{7}-[A-Z]{3}

5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.

c. Select the NaOH reagent kit and select New Lot.
d. Enter the lot details.
e. Set the Status of Reagent Lot toggle switch to Active.
f. Select Save.
g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
h. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 58 Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeqDx v1.2)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Automatically populated with the preset GenerateFASTQ.
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False

Field	Value
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

7. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the v2 sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

> The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

- Select Next Steps.

8. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   > Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

9. Select Finish Step.
   After exiting the step, the following actions occur:
   - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2).
   - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.

   At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2).

   > Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step. The integration adds samples automatically.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.2)

In this protocol, samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.2) step determines the flow cell type.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)
2. Dilute, Denature & ExAmp (NovaSeqDx v1.2)
3. Load to Flowcell (NovaSeqDx v1.2)

Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.2) protocol. The samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, do as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      > Create only one pool.

b. Enter a name for the pool or accept the default name (eg, Pool #1).

c. Select Record Details.

5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen, in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
7. [Optional] In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value if % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, the automation calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol—Dilute, Denature & ExAmp (NovaSeqDx v1.2).

On the Assign Next Steps screen, the next step for samples is set to Dilute, Denature & ExAmp (NovaSeqDx v1.2).

10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeqDx v1.2) step.

Step 2: Dilute, Denature & ExAmp (NovaSeqDx v1.2)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.2) protocol. The pool of samples queued for the Dilute, Denature & ExAmp (NovaSeqDx v1.2) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (refer to the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots, do as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. From Configuration, select the Consumables tab.

For Research Use Only. Not for use in diagnostic procedures.

c. From Consumables, select Reagents.
d. Select one of the reagent kits previously listed and select New Lot.
e. Enter the lot details.
f. Set the Status of Reagent Lot toggle switch to Active.
g. Select Save.
h. Repeat this process to add and activate the remaining reagent lots.
i. Return to your original working browser tab and refresh the page.

6. On the Record Details screen, perform the following actions:
   a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   b. In the Step Details section, verify that the DPX1, DPX2, and DPX3 reagent volume values are populated. The script sets these values and they cannot be edited.
   c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.
   d. Make sure that the following values and columns are populated:
      - BP Aliquot
      - Mastermix per lane
      - NaOH
      - Tris-HCl
      - Flowcell Type
      - Loading Workflow Type

      A script sets these values and columns and they cannot be edited. The working pool number is appended to the bulk pool name, so that you can identify which working pools are derived from the same bulk pool.
7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeqDx v1.2).
9. Select Finish Step.

Step 3: Load to Flowcell (NovaSeqDx v1.2)

1. On the Ice Bucket screen, perform the following actions:
   a. In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   b. Select Begin Work.

2. The Validate Inputs and Selected Container automation checks the following information:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen, do as follows.
   a. Drag pools from the left of the screen over into the Placed Samples area on the right.
   b. Scan or type the barcode of the flow cell into the Flowcell field.
   c. Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type. This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs. The following table shows the barcode mask information.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DR[A-Z0-9]{2}
S1	[A-Z0-9]{5}DR[A-Z0-9]{2}
S2	[A-Z0-9]{5}DM[A-Z0-9]{2}
S4	[A-Z0-9]{5}DS[A-Z0-9]{2}

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. Refer to the following table for details.

   Table 59 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeqDx v1.2) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.

Field	Value
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Library Tube Barcode	Scan the library tube barcode.
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

   The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.

Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)

This protocol contains a single fully automated step: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS (refer to Review Run Data).

Automations

The NovaSeqDx Run (NovaSeqDx v1.2) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) Package include a Set Next Steps automation configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step. You can use this automation to override the default next step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen. To make sure that the Lane Number displays correctly, do not disable or modify this automation.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics displayed on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID

- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global custom fields listed. Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.

1. When setting up a run on the NovaSeq 6000Dx instrument, NVOS sends a request for the run recipe.
   a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step.
   b. Clarity LIMS sends a JSON response to NVOS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).
2. When the run starts, NVOS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates the kit and enables on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVOS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.
4. After primary analysis completes, NVOS sends a request containing the parsed run metrics. NVOS sends a request only when the run completes successfully. However, the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following:
   a. Records the metrics into the fields on file placeholder outputs in Clarity LIMS.
   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.

For Research Use Only. Not for use in diagnostic procedures.

NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction on page 1 provides detailed information on how the following components work with the Sequencer API integration:

- Sample sheet generation and contents
- NovaSeq 6000Dx run
- User authentication and login
- Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Worker*
- *Troubleshooting Automation* in the API

If an error occurs that does not provide direction on how to proceed, (eg, the error is related to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step) review the log file information. For more details, refer to *Logging* on page 78.

If the automated run step starts, but does not complete, do as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS. You can use the Library Tube or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeqDx Standard or NovaSeqDx Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging* on page 78.
3. Contact the Clarity LIMS support team. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2) step, the Sequencer API writes a detailed log file to `/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`.

Log messages include the Library Tube ID and Flow Cell ID whenever the messages are related to a sequencing run-related request. In the Clarity LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most of the log messages for this request. However, the LIMS ID of the file must be known in order to retrieve all messages related to the file download. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (which can also be found in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2021-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell

```

NovaSeq 6000Dx Integration v1.2 Installation

The Illumina NovaSeq 6000Dx Integration v1.2 supports the integration between Clarity LIMS and the NovaSeq 6000Dx instrument. The integration includes the following changes:

- Compatibility with Oracle Linux. For compatibility, refer to *NovaSeq 6000Dx Integration v1.2 Release Notes* on page 89.
- Security fixes.

This document provides instructions for installing NovaSeq 6000Dx Integration v1.2 and describes the components that are installed in the default configuration.

If the user is new to the NovaSeq 6000Dx integration, then follow the instructions provided in this section. If the user has installed NovaSeq 6000Dx Integration v1.1, then note that there are no user-facing changes in the configured workflow between NovaSeq 6000Dx Integration v1.1 and NovaSeq 6000Dx Integration v1.2. It is safe to use the existing NovaSeq 6000Dx v1.1 workflow installed with IPP v2.5 and reconfigure the integration for this workflow instead. For more information, refer to *[Optional] Configure application.yml Properties* on page 87.

Integration Overview

Illumina NovaSeq 6000Dx Integration v1.2 includes the following features and functionality:

- Preconfigured NovaSeqDx v1.2 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeqDx v1.2)

  - NovaSeqDx Standard (NovaSeqDx v1.2) (supports the loading of pooled libraries into a library tube and the IVD sequencing run for the S2 and S4 flow cells)
  - NovaSeqDx Xp (NovaSeqDx v1.2) (supports individual lane loading on the NovaSeq 6000Dx)
  - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)
- Automated generation of the v2 sample sheet. This file is automatically uploaded to the sequencing instrument through the Sequencer API and is used to set up the run.
- Automated validation of run setup information. This information is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) through the Sequencer API. It is used to create the run recipe and initiate the run.
- Automated tracking of the following NovaSeq 6000Dx sequencing run information, and parsing of run statistics into Clarity LIMS:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.1 workflow used for validation purposes. This workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.2 workflow. For more information, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Prerequisites

Prerequisite 1: Secret Utility Configuration

If Clarity LIMS Secret Utility is not installed or configured, use the following information to configure Secret Utility:

Installation on a hosted system with Clarity LIMS (v6.2 or later)

The Clarity LIMS installation tooling configures this installation. No additional configuration is necessary.

Installation on an on-premise Clarity LIMS instance (v6.2 or later)

The installation requires the following passwords:

- Tenant DB Password
- Clarity DB Password
- FTP password
- LDAP manager password (if LDAP is enabled)

- LabLink DB password
- Reporting DB password (if installed)
- RabbitMQ password

For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

Prerequisite 2: Illumina Preset Protocols (IPP) v2.6

The Illumina NovaSeq 6000Dx Integration Package v1.2 depends on the configuration provided in Illumina Protocols (IPP) v2.6.

The installation procedure provided in this document includes steps that install the following IPP configurations on the server used for the NovaSeq 6000Dx integration installation:

- QC Protocols Base configuration
- NovaSeqDx configuration
- Library Prep Validation configuration (optional, but recommended)

For details on IPP v2.6 installation and configuration, refer to the *Illumina Preset Protocols* documentation.

Prerequisite 3: Proxy Update (Illumina Cloud Hosted Installation Only)

The Illumina cloud hosted installation configures an additional include directive for `/etc/httpd/conf.d/clarity.conf` in the proxy configuration. Additional proxy configuration files for the Sequencer API service are expected to be placed in the `/etc/httpd/conf.d/clarity` folder.

Sequencer API RPM Installation Components

NovaSeq 6000Dx Integration v1.2 is distributed as the BaseSpaceLIMS-sequencer-api RPM package. This package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following files and scripts:

- Sequencer API WAR file
- `application.yml` configuration file
- `configure_sequencer_api_proxy.sh` configuration script
- `configure_sequencer_api_env.sh` configuration script
- `configure_sequencer_api_application.sh` configuration script

Sequencer API WAR

The RPM installs the Sequencer API WAR file into the same Tomcat container as Clarity LIMS. The WAR file is installed to the following location:
`/opt/gls/clarity/tomcat/current/webapps/Illumina#Sequencer#v2##2.6.0.0.war`

The version number can differ.

The WAR file is deployed automatically when Clarity LIMS launches. Because the RPM installs a new WAR file, Clarity LIMS is automatically stopped during installation of the RPM. Restart Clarity LIMS before installing the NovaSeq and Library Prep Validation workflow configuration from the IPP.

Configuration File

The `application.yml` configuration file is installed to the following location:

`/opt/gls/clarity/extensions/sequencer-api/application.yml`

The file properties are configured with a script during the installation process.

For a complete list of all properties included in the `application.yml` file, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.

Configuration Scripts

The scripts in the following table are installed to the following location:

`/opt/gls/clarity/config`

During installation, the RPM runs these scripts as they are needed.

Script Name	User	Description
`configure_sequencer_api_proxy.sh`	root	Adds configuration to the proxy to allow communication with the Sequencer API after Tomcat has been started. Run this script in the following scenarios: • When the Sequencer API is first installed. • When reconfiguring the Clarity LIMS proxy. This process happens until a version of Clarity LIMS that includes the necessary configuration files from `/etc/httpd/clarity/*.conf` is available. Not required for Illumina cloud hosted installations.
`configure_sequencer_api_env.sh`	root	Adds Secret Management setting into the Clarity LIMS Tomcat configuration. Run this script when the Sequencer API is first installed on a Secret Util-enabled Clarity LIMS.

For Research Use Only. Not for use in diagnostic procedures.

Script Name	User	Description
`configure_sequencer_api_application.sh`	glsjboss	• Configures the installed `application.yml` file. • Sets the Clarity LIMS URL and the key to use when signing access tokens. Run this script when the Sequencer API is first installed. If you run the script multiple times, the script reconfigures each setting to its default. The only exception is the signing key. For this setting, you are asked if you want a reset. If the reset is done, all previously issued tokens are no longer valid.

Installation Steps

If running the sequencing service and Automation Worker on the same instance, the instance must also be running a compatible version of the Oracle Linux operating system. For compatibility, refer to *NovaSeq 6000Dx Integration v1.2 Release Notes* on page 89.

[Optional] Install QC Protocols

If you are using PhiX control, install the base configuration of the QC Protocols from IPP as follows.

1. Log in as the root user on the server being used to install the integration.
2. Use the following yum command to install the IPP RPM:

```
yum install BaseSpaceLIMS-Illumina-Preset-Protocols --enablerepo=<< repo name info from support >>
```

   The `--enablerepo` command-line argument must be included to enable the repo. The Illumina Support team can provide you with the repo file with the appropriate naming convention.
3. Enter `y` to confirm that you want to proceed with the RPM and package installation.
4. Make sure that NGS Extension Package v5.23 is installed.
   If this package is not installed, you must install it or upgrade the existing package.
5. As the glsjboss user, install the `QC_Protocols.qc-protocols` configuration from the following location:

```
/opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install QC_
Protocols.qc-protocols.
```

For information on IPP installer commands, parameters, and options, refer to the *Illumina Preset Protocols* documentation.

Install Sequencer API

Install the Sequencer API as follows.

1. On the Clarity LIMS server, log in as the root user.
2. Use the following yum command to install the RPM:

```
yum install BaseSpaceLIMS-sequencer-api --enablerepo=< repo name info from
support >
```

   The `--enablerepo` command-line argument must be included to enable the repository. The Illumina Support team can provide you with the repo file with the appropriate naming convention.

3. Enter `y` to confirm that you want to proceed with the RPM installation.
4. If necessary, install the Secret Utility Package.
   For more information on this package, refer to *Prerequisite 1: Secret Utility Configuration* on page 80.
5. As the glsjboss user, run `configure_sequencer_api_application.sh` from the following location:

```
bash /opt/gls/clarity/config/configure_sequencer_api_application.sh
```

6. Enter values for the presented as follows.
   You can also press Enter to accept the default values in the `application.yml` configuration file. For more information about the `application.yml` properties, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.
   - Would you like to use the apiuser user for communication with Clarity? [Y]
   - Enter required value for Token Expiry (hours) [88]
7. Update the Clarity LIMS proxy for the Sequencer API as follows.
   - For an on-premise system, run the following command:

```
bash /opt/gls/clarity/config/configure_sequencer_api_proxy.sh
```

   - For an Illumina cloud hosted system, make sure that the proxy has been updated as follows. Place the `sequencer-api.include` file in `/etc/httpd/conf.d/clarity`.

```
<Location "/Illumina/Sequencer/v2">
ProxyPass ajp://localhost:9009/Illumina/Sequencer/v2
ProxyPassReverse ajp://localhost:9009/Illumina/Sequencer/v2
</Location>
```

8. Update the Clarity LIMS Tomcat configuration as follows.

a. Make sure that Secret Utility is installed and configured. For more information, refer to *Prerequisite 1: Secret Utility Configuration* on page 80.

b. Run the following command to add the Secret Utility configuration to Clarity LIMS:

```
bash /opt/gls/clarity/config/configure_sequencer_api_env.sh
```

> This script modifies `/opt/gls/clarity/tomcat/current/bin/setenv.sh` for Clarity LIMS Tomcat to load the Secret Utility environment variable file (`/etc/profile.d/claritysecret.sh`) during startup.

c. Use the following command to Start Clarity LIMS:

```
/opt/gls/clarity/bin/run_clarity.sh start
```

Install NovaSeqDx and Library Prep Validation Workflow Configuration

Install the NovaSeqDx and Library Prep workflow configuration from IPP as follows.

1. As the glsjboss user, run the following command to install the NovaSeq 6000Dx v1.2 workflow configuration:

```
bash /opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.novaseqdx-v1.2
```

> The installer validates the import of the workflow and provides the Warning/Error details in STDOUT, which allows you to either proceed with the import or cancel it.

2. [Optional] Run the following command to install the Library Prep Validation v2.3.1 workflow:

```
/opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.Library-Prep-Validation-v2.3
```

This step is optional, but recommended. The Library Prep Validation v2.3.1 workflow allows you to validate the NovaSeqDx v1.2 workflow.

Check Sequencer API

Make sure that the Sequencer API is working as follows.

1. Visit `https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/sequencing-run/login`. This page returns the following URL string:

```
https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/oauth/authorize?client_
id=illumina_sequencer&amp;redirect_uri=../sequencer_login&amp;response_
type=token
```

2. Copy and paste the URL string into the browser. The Clarity LIMS Sign In page opens.
3. Enter sign in credentials.
4. Select Sign In. A Successfully Authenticated message displays.

[Optional] Configure `application.yml` Properties

The installer script configures the `application.yml` configuration properties by prompting for values. You can also configure these properties by editing the `application.yml` file, and then restarting Clarity LIMS. Configuring these properties is optional.

For more information, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction*.

Workflows, Protocols, and Steps Installed

NovaSeq 6000Dx Integration v1.2 includes the workflows, protocols, and steps listed in the following table.

Package	Workflow	Protocols	Steps
IPP v2.6	NovaSeqDx v1.2	Run Format (NovaSeqDx v1.2)	1. Define Run Format (NovaSeqDx v1.2)
		NovaSeqDx Standard (NovaSeqDx v1.2)	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.2) 2. Dilute and Denature (NovaSeqDx v1.2)
		NovaSeqDx Xp (NovaSeqDx v1.2)	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.2) 2. Dilute, Denature & ExAmp (NovaSeqDx v1.2) 3. Load to Flowcell (NovaSeqDx v1.2)
		AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.2)
IPP v2.6	Library Prep Validation v2.3.1	Library Prep Validation v2.3.1	1. Library Prep Validation v2.3.1

For detailed descriptions of the steps and automations included in each protocol, and details on other components in the configuration, refer to *NovaSeq 6000Dx Integration v1.2 Configuration and User Interaction* on page 1.

For instructions on using the Library Prep Validation v2.3.1 protocol, refer to *NovaSeq 6000Dx Integration v1.2 Validation and Troubleshooting* on page 59.

Instrument Software

The NovaSeq 6000Dx instrument software includes the following components:

- NovaSeq 6000Dx Operating Software (NVOS)—Contains the user interface for setting up the sequencing run. Responsible for controlling the instrument and acquiring the images.
- Real-Time Analysis v3 (RTA3)—Takes the images generated by the first module, processes, and analyzes them. Makes sure that data files are created and copied to the final destination folder.
- Sequencing Analysis Viewer (SAV)—Displays the important quality metrics generated by the RTA3 software.
- NovaSeq 6000Dx recipes—Provides system operation instructions for use with NovaSeq 6000Dx reagent kits for SP, S1, S2, and S4 flow cells.
- Universal Copy Service—Copies output files to destinations such as final destination folder and/or BaseSpace Sequence Hub (when the instrument is configured for use with BaseSpace Sequence Hub).

Instrument Integration Configuration

For the NovaSeq 6000Dx API integration to work, the instrument must be able to communicate with Clarity LIMS through the API. Complete the following steps to configure the NVOS and confirm that you can access Clarity LIMS from the instrument.

1. Launch NVOS and wait for the initialization process to complete.
2. On the NVOS Instrument Settings page, do as follows.
   a. Select the Global Settings tab.
   b. Under Instrument Mode, select one of the following modes:
      - Allow users to switch between IVD and RUO
      - IVD Only
      - RUO Only
3. If you selected IVD Only instrument mode, select the IVD Settings tab and complete the following steps:
   a. Configure Run Setup as follows.
      - Select the Select runs from the LIMS server option.
      - Enter the Clarity LIMS URL (eg, `https://yourserver.claritylims.com`).
   b. [Optional] Under Output Location, enter the output folder location. You can also specify the output folder location when setting up a run in NVOS.

4. If you selected RUO Only instrument mode, select the RUO Settings tab and complete the following steps:
   a. Configure Run Setup as follows.
      - Select the Select runs from the LIMS server option.
      - Enter the Clarity LIMS URL(eg, `https://yourserver.claritylims.com`).
   b. Configure Default Work Type as follows.
      - [Optional] If selection support between NovaSeq Xp or NovaSeq Standard is required for the workflow, select the Enable workflow selection checkbox.
      - Select the required default workflow type: NovaSeq Standard or NovaSeq Xp.
   c. [Optional] Configure Output Location as follows.
      - [Optional] Enter the output folder location. You can also specify the output folder location when setting up a run in NVOS.
      - [Optional] To upload and store run data in the cloud server, select the BaseSpace Sequence Hub checkbox. Select a Configuration option (Run Monitoring and Storage or Run Monitoring Only) and select your Hosting Location from the drop-down list.
5. Select Save to complete the configuration.
6. On the NVOS home page, you can now select Sequence to log into Clarity LIMS and start a run.

NovaSeq 6000Dx Integration v1.2 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeqDx Integration Package v1.2.

Compatibility

This version of the integration package is compatible with the following software:

- BaseSpace Clarity LIMS v6.2 and later
- NGS Extensions Package v5.23 and later
- Illumina Preset Protocols (IPP) v2.6.0 and later
- NovaSeq 6000Dx Operating Software (NVOS) v2.3.1
- Oracle Linux (64-bit) v8.8

New Features

Updated Groovy to v3.0.7.

Defects Fixed

During configuration, you can now validate the existence of the input user instead of resetting the user and password.

Known Issues

None

NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction

Illumina NovaSeqDx Integration Package v1.1 supports the integration of Clarity LIMS to Illumina NovaSeq 6000Dx instruments. This integration supports Clarity LIMS v5.1 and later.

For instructions on validating and troubleshooting Illumina NovaSeqDx Integration Package v1.1, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

The configuration provided in this integration has been established to support NovaSeq 6000Dx lab processes. Any configuration changes to protocols or workflows—including renaming protocols, steps, and fields—could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeqDx v1.1 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeqDx v1.1)
  - NovaSeqDx Standard (NovaSeqDx v1.1) (supports the loading of pooled libraries into a library tube)
  - NovaSeqDx Xp (NovaSeqDx v1.1) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)
- Automated generation of v2 sample sheet. This file is automatically uploaded to the instrument via the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeqDx sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
  - [Optional] Preconfigured Library Prep Validation v2.3.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.1 workflow. For more

information, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148. The Library Prep Validation v2.3.0 workflow is available in the Illumina Preset Protocols (IPP) v2.5 package.

Prerequisites and Assumptions

Samples enter the NovaSeqDx v1.1 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000Dx Integration Package v1.1 includes the following workflows:

- NovaSeqDx v1.1
- Library Prep Validation v2.3.0 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 60 NovaSeq 6000Dx Integration Package v1.1 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
Library Prep Validation v2.3.0 Workflow		
Library Prep Validation v2.3.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeqDx v1.1) protocol. The protocol contains a single step - Library Prep Validation v2.3.0. After this step, a routing script sends the samples to the first step of the NovaSeqDx v1.1 workflow - Define Run Format (NovaSeqDx v1.1).	1. Library Prep Validation v2.3.0
NovaSeqDx v1.1 Workflow		

Protocol Name	Protocol Purpose	Protocol Steps
Run Format (NovaSeqDx v1.1)	Allows for the assignment of per sample values for the following properties: • NovaSeqDx Run Mode: Select either RUO or DX. • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity (nM): Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeqDx Standard or NovaSeqDx Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeqDx v1.1)
NovaSeqDx Standard (NovaSeqDx v1.1)	Samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) protocol.	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) 2. Dilute and Denature (NovaSeqDx v1.1)

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeqDx Xp (NovaSeqDx v1.1)	Samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.1) step determines the flow cell type. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) protocol.	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) 2. Dilute, Denature & ExAmp (NovaSeqDx v1.1) 3. Load to Flowcell (NovaSeqDx v1.1)
AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)

Validation Workflow

The Library Prep Validation v2.3.0 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Step Automations

The following table lists the step automations included in the NovaSeqDx v1.1 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Table 61 NovaSeq 6000Dx v1.1 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeqDx v1.1)	1. Define Run Format (NovaSeqDx v1.1)	Routing Script Set Next Steps

Protocol	Step	Automation
2. NovaSeqDx Standard (NovaSeqDx v1.1)	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Single NovaSeqDx Run Mode Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute and Denature (NovaSeqDx v1.1)	Routing Script Validate Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeqDx Xp (NovaSeqDx v1.1)	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute, Denature, and ExAmp (NovaSeqDx v1.1)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeqDx v1.1)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet
4. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)	Update Lane Number Set Next Steps (Not used. By default, the Sequencer API determines this functionality. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Terminology

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Protocol 1: Run Format (NovaSeqDx v1.1)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeqDx Standard (NovaSeqDx v1.1) or the NovaSeqDx Xp (NovaSeqDx v1.1) protocol.

This protocol contains one step: Define Run Format (NovaSeqDx v1.1).

Step 1. Define Run Format (NovaSeqDx v1.1)

Step input: Normalized Template Plate (NTP, normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Checks NovaSeqDx Run Mode, Loading Workflow Type, and Flowcell Type. Only the NovaSeq Standard with the S2/S4 flow cell is supported for the NovaSeqDx Run Mode:

```
if (input.::NovaSeqDx Run Mode:: == ::DX::) {
    if (input.::Loading Workflow Type:: == ::NovaSeq Xp::) {
        fail(::Invalid option selected. NovaSeq Standard shall be selected for DX
        mode.::);
    };
    if (input.::Flowcell Type:: == ::SP:: || input.::Flowcell Type:: == ::S1::) {
        fail(::Invalid option selected. Only S2 or S4 flowcell shall be selected
        for DX mode.::);
```

```
    };
};
```

- Calculates the Minimum Molarity with the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares the Normalized Molarity value of each sample with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, this sets the Loading Workflow Type of the sample to [Remove from workflow]. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
    input.::Warning:: = ::The Normalized Molarity is too low.::;
    input.::Loading Workflow Type:: = ::[Remove from workflow]::;
} else {
    input.::Warning:: = ::n/a::
}
```

At this point, the following options are available:

- Correct the NovaSeqDx Run Mode and Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeqDx v1.1 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeqDx v1.1 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step.

Default automation command line is as follows.

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeqDx v1.1' \
--STEP 'Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeqDx v1.1' \
--STEP 'Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Master Step Fields

There are four fields defined on the Define Run Format (NovaSeqDx v1.1) master step.

The following table lists field configuration details.

Table 62 Define Run Format (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text		None
Flowcell Type	Text Dropdown	Required Field Custom Entries	Presets • SP • S1 • S2 • S4
Instruction	Text	Read Only	Default • Add Flowcell Type, Loading Workflow Type, and NovaSeqDx Run Mode
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp

For Research Use Only. Not for use in diagnostic procedures.

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeqDx v1.1) step.

Table 63 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Presets • 225 • 400 Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
NovaSeqDx Run Mode	Text Dropdown	Required Field	Presets • DX • RUO
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Warning	Text Dropdown	Read Only Custom Entries	Presets • The Normalized Molarity (nM) is too low. • Not applicable

User Interaction

Refer to Run Define Run Format (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.1)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeqDx Run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) protocol.

This protocol contains the following two steps:

- Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)
- Step 2: Dilute and Denature (NovaSeqDx v1.1)

Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Single NovaSeqDx Run Mode

The Validate Single NovaSeqDx Run Mode automation is triggered on entry of the step. The following automation checks that all input samples have the same NovaSeqDx Run Mode assigned:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
```

```
script:validate_same_analyte_udf_value_for_all_inputs \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-f 'NovaSeqDx Run Mode'"
```

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when you select the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
```

```
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, this automation completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field of the sample.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: +
input.::Adjusted Per Sample Volume (ul)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::
} ;
```

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value a calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type.

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S1:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
output.::Volume of Pool to Denature (ul):: = 150 ;
output.::NaOH Volume (ul):: = 37 ;
output.::Tris-HCl Volume (ul):: = 38
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
output.::Volume of Pool to Denature (ul):: = 310 ;
output.::NaOH Volume (ul):: = 77;
output.::Tris-HCl Volume (ul):: = 78
}
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download in the Files section of the Record Details milestone in the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
      Bulk_Pool1.csv \
      -o 1.csv \
   script:driver_file_generator \
```

```
        -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
        Bulk_Pool2.csv \
        -o 2.csv \
    script:driver_file_generator \
        -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
        Bulk_Pool3.csv \
        -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the Dilute and Denature (NovaSeqDx v1.1) step in the protocol:

```
nextStep = ::ADVANCE::
```

The following automation copies the NovaSeqDx Run Mode values from the step inputs to the step outputs:

```
output.::NovaSeqDx Run Mode:: = input.::NovaSeqDx Run Mode::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step. The following table lists configuration details.

Table 64 Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100 Decimal places displayed = 0

Field Name	Field Type	Options	Additional Options and Dropdown Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step.

Table 65 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Volume of Pool to Denature (µl) (Used in Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step only. Displays on Record Details screen and in the generated CSV file.)	Numeric	Read Only	Decimal places displayed = 0

User Interaction

Refer to Run Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Step 2: Dilute and Denature (NovaSeqDx v1.1)

In this step, the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB) denatures and dilutes pooled samples. Manually place the pooled samples into the library tube for the NovaSeqDx Run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the following barcode masks:
  - DX mode: DX[0-9]{7}-[A-Z]{3}
  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}

```
if ((input.::NovaSeqDx Run Mode:: == ::DX:: && !output.container.name.matches
(::^DX[0-9]{7}-[A-Z]{3}$::)) || (input.::NovaSeqDx Run Mode:: == ::RUO:: &&
!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::))) {
fail(::Invalid Library Tube Barcode. Please verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

Triggered by a button on the Record Details screen, this automation completes the following actions:

> The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit. If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. The parameters are as follows. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000Dx Run* on page 135.
  - Experiment Name only contains alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.

  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values as follows.
  - If Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - If Paired End = False, Read 2 Cycles must be zero.

```
if (step.::Paired End::.toBoolean()) {
   if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
      fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
      End is True.::)
   }
} else {
   if (step.::Read 2 Cycles:: != 0) {
      fail(::Read 2 Cycles must be 0 if Paired End is False.::)
   }
};
```

- Checks the Flowcell field value as follows.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
```

For Research Use Only. Not for use in diagnostic procedures.

```
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to contain only Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Generates the V2 sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 134.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeqDx v1.1 workflow, and queues them for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.

The default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid1}
script:changeWorkflow \
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeqDx v1.1' \
--STEP 'AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

There are 19 fields defined on the Dilute and Denature (NovaSeqDx v1.1) step. These fields are required for sample sheet and JSON file generation.

The following table lists field configuration details.

Table 66 Dilute and Denature (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Not Used Run Monitoring Only Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Output Folder	Text	Required Field	
Override Cycles	Text		
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Read 2 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Run Mode (Not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

For Research Use Only. Not for use in diagnostic procedures.

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail
(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) } }; if (input.::Flowcell Type:: != ::SP:: &&
step.::Read 1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: &&
step.::Read 2 Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (step.hasValue(::Analysis Software
Version::) && !step.::Analysis Software Version::.matches(::^(\\d+)
(\\.\\d+)*$::)) { fail(::Analysis Software Version contains prohibited
characters. Allowed characters are 0-9 and period. It shall start and end with
numbers and separated by single period e.g. 3.8.4::) }; if (step.hasValue
(::Override Cycles::) && !step.::Override Cycles::.matches(::[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::) }; nextStep =
::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeqDx v1.1) step.

Table 67 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Dilute and Denature (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.1)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeqDx flow cell type selected in the Define Run Format (NovaSeqDx v1.1) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)
- Step 2: Dilute, Denature, and ExAmp (NovaSeqDx v1.1)
- Step 3: Load to Flowcell (NovaSeqDx v1.1)

Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type:

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22;
step.::PhiX Volume (ul):: *= 0.8;
};
```

```
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30;
step.::PhiX Volume (ul):: *= 1.1;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
    output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
    Sample Volume (ul)::
} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

For Research Use Only. Not for use in diagnostic procedures.

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download in the Files segment of the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
      Pool.csv \
      -o {compoundOutputFileLuid0}.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
      Pool2.csv \
      -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step.

Table 68 Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric		Range = 0– 100

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (µl)	Numeric	Required Field	Default • 5 Decimal places displayed = 2
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step.

Table 69 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Step 2: Dilute, Denature and ExAmp (NovaSeqDx v1.1)

In this step, the addition of DPX, NaOH, Tris-HCl, and RSB denatures and dilutes pooled samples. Manually create working pools based on the number of lanes that you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number (choose how many working pools to create per bulk pool)

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4). This automation also checks that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

For Research Use Only. Not for use in diagnostic procedures.

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (µl):: = 18 ;
output.::NaOH Volume (µl):: = 4 ;
output.::Tris-HCl Volume (µl):: = 5 ;
step.::DPX1 Volume (µl):: = 126 ;
step.::DPX2 Volume (µl):: = 18 ;
step.::DPX3 Volume (µl):: = 66 ;
output.::Mastermix per Lane (µl):: = 63
};

if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4 ;
output.::Tris-HCl Volume (µl):: = 5 ;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5 ;
output.::Tris-HCl Volume (µl):: = 6 ;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
```

```
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7 ;
output.::Tris-HCl Volume (µl):: = 8 ;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. This file contains information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download in the Files segment of the Dilute, Denature & ExAmp (NovaSeqDx v1.1) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool.csv \
      -o {compoundOutputFileLuid0}.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool2.csv \
      -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are three fields defined on the Dilute, Denature & ExAmp (NovaSeqDx v1.1) step. A script sets these field values. They are not editable while running the step.

The following table lists field configuration details.

Table 70 Dilute, Denature & ExAmp (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature & ExAmp (NovaSeqDx v1.1) step.

Table 71 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	• Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

Refer to Run Dilute, Denature & ExAmp (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Step 3: Load to Flowcell (NovaSeqDx v1.1)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeqDx run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.

The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-
Z0-9]{5}DM[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-
Z0-9]{5}DS[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
```

```
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file.
  - Experiment Name only contains alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be 0.
  - When Workflow Type = Single Index, Index Read 1 must be greater than 0 and Index Read 2 must be 0.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than 0.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
```

For Research Use Only. Not for use in diagnostic procedures.

```
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - When Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - When Paired End = False, Read 2 Cycles must be 0.

```
if (step.::Paired End::.toBoolean()) {
   if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
      fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
      End is True.::)
   }
} else {
   if (step.::Read 2 Cycles:: != 0) {
      fail(::Read 2 Cycles must be 0 if Paired End is False.::)
   }
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If the value is greater than 151, an error message displays.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validate Analysis Software Version

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Checks Override Cycles field value. This field contains only Y, N, I, U, 0–9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 134.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}
```

Master Step Fields

The following table lists the field configuration details for the fields defined on the Load to Flowcell (NovaSeqDx v1.1) step.

Table 72 Load to Flowcell (NovaSeqDx v1.1) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Presets • 0 • 6 • 8 Range = 0–20 Decimal places displayed = 0
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Presets • 0 • 6 • 8 Range = 0–20 Decimal places displayed = 0
Library Tube Barcode	Text	Required Field	
Output Folder	Text	Required Field	
Override Cycles	Text		
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Presets • 251* • 151 • 101 • 51 Range = 1–251 Decimal places displayed = 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Presets • 251* • 151 • 101 • 51 Range = 0–251 Decimal places displayed = 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Validation Script	Multiline Text	Required Field Read Only	Default value provided in the drop-down section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail
(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
```

For Research Use Only. Not for use in diagnostic procedures.

```
Paired End is False.::) }}; if (input.::Flowcell Type:: != ::SP:: && step.::Read
1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151 if it is
not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 2
Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151 if it is not
SPrime Flowcell::) }; if (step.hasValue(::Analysis Software Version::) &&
!step.::Analysis Software Version::.matches(::^(\\d+)(\\.\\d+)*$::)) { fail
(::Analysis Software Version contains prohibited characters. Allowed characters
are 0-9 and period. It shall start and end with numbers and separated by single
period e.g. 3.8.4::) }; if (step.hasValue(::Override Cycles::) &&
!step.::Override Cycles::.matches(::[YNIU0-9;]+::)) { fail(::Override Cycles
contains prohibited characters. Allowed characters are: Y, N, I, U, 0-9 and ;.
Example: N1Y150;I8;I7N1;Y141U10.::) }; step.::Settings Header:: = step.hasValue
(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::
[Settings]:: : ::::; nextStep = ::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeqDx v1.1) step.

Table 73 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Analyte in Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

For more information, refer to the Run Load to Flowcell (NovaSeqDx v1.1) step section in *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)

This final protocol contains one fully automated step, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1).

This step is fully automated. Do not add samples to the Ice Bucket or start the step manually. If steps are manually started, the sequencing service does not update the samples correctly.

Step 1: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)

Step input: Library tube from NovaSeqDx Standard or flow cell from NovaSeqDx Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq 6000Dx instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configure Autocomplete Properties* on page 146.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following table shows the master step fields that are configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.

Table 74 Clarity LIMS Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Current Cycle	Numeric	Read Only	Decimal places displayed = 0
Current Read	Numeric	Read Only	Decimal places displayed = 0

Field Name	Field Type	Options	Additional Options and Dropdown Items
Firmware Version	Text	Read Only	
Flow Cell Expiration Date	Date	Read Only	
Flow Cell ID	Text	Read Only	
Flow Cell Lot Number	Text	Read Only	
Flow Cell Mode	Text	Read Only	
Flow Cell Part Number	Text	Read Only	
Flow Cell Side	Text	Read Only	
Instrument Control Software Version	Text	Read Only	
Instrument ID	Text	Read Only	
Instrument Type	Text	Read Only	
Lane Counter	Numeric	Read Only	Default • 1 Hidden
Loading Workflow Type	Text	Read Only	
Output Folder	Text	Read Only	
RTA Version	Text	Read Only	
Run Completion Date	Text	Read Only	Hidden
Run ID	Text	Read Only	
Run Status	Text	Read Only	
Sequencing Log	Multiline Text	Read Only	

Global Fields

The following table shows the global custom fields that capture the run metrics in Clarity LIMS.

For Research Use Only. Not for use in diagnostic procedures.

Table 75 Custom Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% Aligned R1	Numeric	Read Only	Decimal places displayed = 2
% Aligned R2	Numeric	Read Only	Decimal places displayed = 2
% Bases >=Q30 R1	Numeric	Read Only	Decimal places displayed = 2
% Bases >=Q30 R2	Numeric	Read Only	Decimal places displayed = 2
% Error Rate R1	Numeric	Read Only	Decimal places displayed = 2
% Error Rate R2	Numeric	Read Only	Decimal places displayed = 2
% Phasing R1	Numeric	Read Only	Decimal places displayed = 3
% Phasing R2	Numeric	Read Only	Decimal places displayed = 3
% Prephasing R1	Numeric	Read Only	Decimal places displayed = 3
% Prephasing R2	Numeric	Read Only	Decimal places displayed = 3
%PF R1	Numeric	Read Only	Decimal places displayed = 2
%PF R2	Numeric	Read Only	Decimal places displayed = 2
Cluster Density (K/mm^2) R1	Numeric	Read Only	
Cluster Density (K/mm^2) R2	Numeric	Read Only	
Intensity Cycle 1 R1	Numeric	Read Only	
Intensity Cycle 1 R2	Numeric	Read Only	

Field Name	Field Type	Options	Additional Options and Dropdown Items
Reads PF (M) R1	Numeric	Read Only	Decimal places displayed = 2
Reads PF (M) R2	Numeric	Read Only	Decimal places displayed = 2
Yield PF (Gb) R1	Numeric	Read Only	Decimal places displayed = 2
Yield PF (Gb) R2	Numeric	Read Only	Decimal places displayed = 2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeqDx v1.1 configuration provided in the Illumina Preset Protocols (IPP) Package v2.5 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If field names are changed in Clarity LIMS, they must also be changed through the run.metricUdfNames properties file in the `application.yml` file for the Sequencer API. All fields are configured to be visible on the Record Details screen for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step (in the Sample Details table). For more information, refer to the *application.yml Properties* section of *Components Installed* on page 140.

These global custom fields are configured on the Container entity, visible on each input, and must not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq 6000Dx Operating Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run. This step is either Dilute and Denature (NovaSeqDx v1.1) in the NovaSeqDx Standard protocol or Load to Flowcell (NovaSeqDx v1.1) in the NovaSeqDx Xp protocol. This step places samples on the library tube or flow cell that is loaded in the NovaSeq 6000Dx instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one sample sheet file for use with bcl2fastq v2.20 downstream analysis. This file is in the comma-separated values (CSV) format.

The sample sheet is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq 6000Dx.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The following step custom fields that display in the Step Details area of the Record Details screen control the sample sheet content:

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Index 1 Cycles
- Index 2 Cycles
- Analysis Software Version
- Override Cycles

For detailed information on the following items, refer to the bcl2fastq2 *Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542.

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000Dx Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000Dx instrument.

User Authentication and Login

User authentication and login to the NovaSeq 6000Dx instrument is achieved with the getSequencerLoginURL endpoint (`/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq 6000Dx Operating Software (NVOS) with a URL for the Clarity LIMS login screen. The NVOS displays this screen to the user. Log in to authorize NVOS to use your account to access Clarity LIMS. This authorization is automatic.

2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact Clarity LIMS at `http://localhost:9080/clarity/`. The installation script sets the URL, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 140.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by redirecting to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeqDx to continue with run setup.
   - If authentication fails, the login screen does not change and a warning message displays. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000Dx of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The sequencing-run/recipe/NovaSeqDx endpoint consumes a POST request with a LibraryContainerId, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagents are provided by the NovaSeq 6000Dx.
   - LibraryContainerId and FlowCellId can match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   > Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 140.
3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVOS via the API. Then, the run receipt is generated.

Note the following details:

- The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
- By default, the parent process/master step is the Dilute and Denature (NovaSeqDx v1.1) or Load to Flowcell (NovaSeqDx v1.1) step, depending on workflow.
- The default field values match the names of the fields in the NovaSeq 6000Dx v1.1 configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each property corresponds to an entry in the recipe. The value of a property defines the name of the field that is used to populate that entry in the recipe.
- It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
- The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step is configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. If no matching output is found, or no file was attached to the output, the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 236.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The sample sheet contents and the fields configured on the Dilute and Denature (NovaSeqDx v1.1) and Load to Flowcell (NovaSeqDx v1.1) steps control the contents of the run recipe.

Example of run recipe content is as follows.

```
{
"run_name": "NVOS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
```

```
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found, or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged, and the API cannot complete the step without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored, and a warning is logged during lot tracking.
3. The type of flow cell being used in the run determines the number of replicates for the step.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.

For Research Use Only. Not for use in diagnostic procedures.

5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged, and the reagent is ignored.
   - You can look up existing reagent lots by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and step 2.
   - Name—Serial number in request.
   - Lot Number—Lot number in request.
   - Expiry—Expiry date in request.
   - Status—Active.

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.
6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 139.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 139.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Finds the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.

For Research Use Only. Not for use in diagnostic procedures.

2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the user ends a sequencing run, the API call for Sequencing RunEndedByUser is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000Dx Integration v1.1 is distributed as an RPM package, BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- The following configuration scripts:

- `configure_sequencer_api_proxy.sh`
- `configure_sequencer_api_env.sh`
- `configure_sequencer_api_application.sh`

The NovaSeq 6000Dx v1.1 configuration is delivered through the Illumina Preset Protocols (IPP) Package v2.5. IPP Package v2.5 requires installation of NGS Extensions Package v5.22.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.22.0 is installed, the latest version is installed by default with the NovaSeq 6000Dx integration. For details, refer to *NovaSeq 6000Dx Integration v1.1 Release Notes* on page 184.
- If NGS Extensions Package v5.22.0 or later is already installed, upgrade is not forced or required.

NovaSeq 6000Dx Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for NovaSeqDx v1.1 API.
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMS Tomcat configuration to include Secret Util settings.
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API (NovaSeqDx v1.1 API) application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with Clarity LIMS.

`application.yml` Properties

The `application.yml` file is at `opt/gls/clarity/extensions/sequencing-api/`.

- All properties are configured automatically during installation. You can also configure properties after installation, by editing the `application.yml` file. If you make changes to the file, you must restart Tomcat.

- File properties represent all custom field names, both for recipe and run information.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, the Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 76 `application.yml` Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (configure_sequencer_api_application) prompts for this property.
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that is used when signing/validating OAuth tokens. Changing this property invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq 6000Dx sequencing run step names for which the integration can find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line is indented to the same point and start with a dash (-). Default - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)

Property	Description

novaseq.flowcells	List of supported NovaSeq 6000Dx flow cell types.
	• Type names exactly match the values used by the NVOS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default value:
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4"`
	`lanes: 4`

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	- lotName: The name of the lot as it appears in the run started request.
	- kitName: The name of the corresponding reagent kit in Clarity LIMS that is used for lot tracking.
	• The name can differ in the NVOS request versus the Clarity LIMS configuration.
	Default value:
	`- lotName: "Buffer"`
	`kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to *Run Recipe Contents* section in *NovaSeq 6000Dx Run* on page 135. • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section in *NovaSeq Run* on page 583 • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file global custom field names to be used when recording run results. These are the fields that capture the run data. For more information, refer to *Global Custom Fields* section.
run.autoComplete	Determines whether the sequencing run step is completed automatically after parsing the run metrics on a run (refer to run.autoCompleteOnlyAtSuccess). Default value: true For more information, refer to the *Configure Autocomplete Properties* on page 146 section.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.autoCompleteOnlyAtSuccess	Determines which of the following options are applicable to the sequencing run step: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true For more information, refer to the *Configure Autocomplete Properties* on page 146 section.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris-HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the following formats:

  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}
    Example: AB1234567-LIB
  - DX mode: DX[0-9]{7}-[A-Z]{3}
    Example: DX1234567-LIB
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DR[A-Z0-9]{2}
  - S2 flow cell: [A-Z0-9]{5}DM[A-Z0-9]{2}
  - S4 flow cell: [A-Z0-9]{5}DS[A-Z0-9]{2}
    Example: H1991DMXX

NVOS Configuration

For details on configuring the NovaSeq 6000Dx Operating Software (NVOS) for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

- On the steps that use the routing script (Define Run Format (NovaSeqDx v1.1) and Dilute and Denature (NovaSeqDx v1.1)):
  - The Next Step for all samples must be set to Remove from workflow. A script sets this value. The value must not change in the Assign Next Steps screen.
- In the protocol configuration screen, the following settings are required and must not be changed:
  - In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.

Configure Autocomplete Properties

The `application.yml` configuration file contains l the following properties:

- run.autoCompleteOnlyAtSuccess
- run.autoComplete

These properties determine the conditions under which the last step of the NovaSeq 6000Dx workflow, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1), is automatically completed. The two scenarios for autocompletion of the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step are as follows.

- The step autocompletes only when the run status is RunCompletedSuccesfully (default behavior).
- The step autocompletes regardless of the run status.

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, the step must be completed manually in Clarity LIMS.

For the step to autocomplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enable/Disable autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccess property as required.
3. Save the file.

autoComplete Properties

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 77 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true	true	• Step automatically completes only if the sequencing run is successful. • If run is not successful, the step does not automatically complete, and the run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:

  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There must not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples. All other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542.
- Do not manually start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, the Validate Run Setup and Generate Sample Sheet button must be selected.

NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeqDx Integration Package v1.1. The integration only supports Clarity LIMS v5.1 and later.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeqDx v1.1 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeqDx v1.1) step to the NovaSeqDx Standard (NovaSeqDx v1.1) or NovaSeqDx Xp (NovaSeqDx v1.1) step.
  - Automated generation of v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq 6000Dx sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the NovaSeqDx Integration Package v1.1 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v2.3.0 and NovaSeqDx v1.1 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.3.0 and NovaSeqDx v1.1 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.0

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.1 workflow.

Run Library Prep Validation v2.3.0

1. In Lab View, locate the Library Prep Validation v2.3.0 protocol.
   Samples are queued for the Library Prep Validation v2.3.0 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity. Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeqDx.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

For Research Use Only. Not for use in diagnostic procedures.

Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeqDx from the adjacent drop-down list. Select Apply.

If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
c. In the spreadsheet, enter the Molarity (nM) and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.
d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
   Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeqDx v1.1 workflow, Define Run Format (NovaSeqDx v1.1). This is the only step in Protocol 1: Run Format (NovaSeqDx v1.1).

Protocol 1: Run Format (NovaSeqDx v1.1)

This protocol includes a single step, Define Run Format (NovaSeqDx v1.1). The step allows for the assignment of per sample values for the following fields:

- NovaSeqDx Run Mode
- Loading Workflow Type
- Normalized Molarity
- Flowcell Type
- Final Loading Concentration (pM)

At the end of the step, samples are routed to the NovaSeqDx Standard or NovaSeqDx Xp protocol. This routing is done according to the selected Loading Workflow Type. The selected NovaSeqDx Run Mode must be compatible with the Loading Workflow Type and Flowcell Type.

Step 1: Run Define Run Format (NovaSeqDx v1.1)

1. In Lab View, locate the Run Format (NovaSeqDx v1.1) protocol. The samples are queued for the Define Run Format (NovaSeqDx v1.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - NovaSeqDx Run Mode—Select DX or RUO.
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.
   - Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.
5. Select Next Steps, which triggers the Set Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Checks that the NovaSeqDx Run Mode value is compatible with the Loading Workflow Type and Flowcell Type. This automation also generates an error message if the Loading Workflow Type or the Flowcell Type are incompatible.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is recorded in the Warning field for the sample.
     To proceed, choose one of the following options:

For Research Use Only. Not for use in diagnostic procedures.

- Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.

7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step. This step is the first step in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step. This step is the first step in the NovaSeq Xp protocol.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.1)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)
2. Dilute and Denature (NovaSeqDx v1.1)

Step 1: Run Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1)

1. In Lab View, locate the NovaSeqDx Standard (NovaSeqDx v1.1) protocol.
   Samples for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
   When the step begins, the Validate Single NovaSeqDx Run Mode automation is triggered. This automation checks that the samples have the same NovaSeqDx Run Mode (RUO or DX).
4. On the Pooling screen, perform the following actions:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (eg, Pool #1).
   c. Select Record Details.
      After exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation verifies the following items:

For Research Use Only. Not for use in diagnostic procedures.

- All samples in the pool have been assigned the same Flowcell Type.
- Only one pool has been created.

5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.
   - Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, it calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples that it contains. Select the file to download it and then open it in Excel.
8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeqDx v1.1). The automation also copies the NovaSeqDx Run Mode value from the input pool to the output pool.

On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeqDx v1.1).

9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeqDx v1.1) step.

Step 2: Run Dilute and Denature (NovaSeqDx v1.1)

1. In Lab View, locate the NovaSeqDx Standard (NovaSeqDx v1.1) protocol. The pool of samples queued for the Dilute and Denature (NovaSeqDx v1.1) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask that corresponds with the NovaSeqDx Run Mode in the following table. If the barcode does not match, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.

NovaSeqDx Run Mode	Valid Barcode Mask
RUO	[A-Z]{2}[0-9]{7}-[A-Z]{3}
DX	DX[0-9]{7}-[A-Z]{3}

5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select the NaOH reagent kit and select New Lot.
   d. Enter the lot details.
   e. Set the Status of Reagent Lot toggle switch to Active.
   f. Select Save.
   g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
   h. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 78 Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeqDx v1.1)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Automatically populated with the preset GenerateFASTQ.
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False

Field	Value
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

7. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

> The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

- Select Next Steps.

8. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   > Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

9. Select Finish Step.
   After exiting the step, the following actions occur:
   - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1).
   - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.

   At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1).

   > Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step. The integration adds samples automatically.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.1)

In this protocol, samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.1) step determines the flow cell type.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)
2. Dilute, Denature & ExAmp (NovaSeqDx v1.1)
3. Load to Flowcell (NovaSeqDx v1.1)

Step 1: Run Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.1) protocol. The samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, do as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      > Create only one pool.

b. Enter a name for the pool or accept the default name (eg, Pool #1).

c. Select Record Details.

5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen, in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
7. [Optional] In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value if % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, the automation calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol—Dilute, Denature & ExAmp (NovaSeqDx v1.1).

On the Assign Next Steps screen, the next step for samples is set to Dilute, Denature & ExAmp (NovaSeqDx v1.1).

10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeqDx v1.1) step.

Step 2: Run Dilute, Denature & ExAmp (NovaSeqDx v1.1)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.1) protocol. The pool of samples queued for the Dilute, Denature & ExAmp (NovaSeqDx v1.1) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (refer to the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots, do as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.

For Research Use Only. Not for use in diagnostic procedures.

c. Enter the lot details.
d. Set the Status of Reagent Lot toggle switch to Active.
e. Select Save.
f. Repeat this process to add and activate the remaining reagent lots.
g. Return to your original working browser tab and refresh the page.

6. Add and activate reagent lots as follows.
   On the Record Details screen, the Reagent Lot Tracking section tracks the reagents used in the step.
   a. In a new browser tab, open another instance of Clarity LIMS.
   b. Navigate to the Consumables screen.
   c. Select one of the following reagent kits:
      - DPX1
      - DPX2
      - DPX3
      - NaOH
      - Resuspension buffer
      - Tris-HCl
   d. Select New Lot.
   e. Enter the lot details.
   f. Set the Status of Reagent Lot toggle switch to Active.
   g. Select Save.
   h. Repeat steps c–g for the remaining reagent lots.
   i. Return to the original instance of Clarity LIMS and refresh.
7. On the Record Details screen, perform the following actions:
   a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   b. In the Step Details section, verify that the DPX1, DPX2, and DPX3 reagent volume values are populated. The script sets these values and they cannot be edited.
   c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.
   d. Make sure that the following values and columns are populated:
      - BP Aliquot
      - Mastermix per lane
      - NaOH
      - Tris-HCl

For Research Use Only. Not for use in diagnostic procedures.

- Flowcell Type
- Loading Workflow Type

A script sets these values and columns and they cannot be edited. The working pool number is appended to the bulk pool name, so that you can identify which working pools are derived from the same bulk pool.

8. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
9. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeqDx v1.1).
10. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeqDx v1.1)

1. On the Ice Bucket screen, perform the following actions:
   a. In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   b. Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following information:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen, do as follows.
   a. Drag pools from the left of the screen over into the Placed Samples area on the right.
   b. Scan or type the barcode of the flow cell into the Flowcell field.
   c. Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type. This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs. The following table shows the barcode mask information.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DR[A-Z0-9]{2}
S1	[A-Z0-9]{5}DR[A-Z0-9]{2}

Flowcell Type	Barcode Mask
S2	[A-Z0-9]{5}DM[A-Z0-9]{2}
S4	[A-Z0-9]{5}DS[A-Z0-9]{2}

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. Refer to the following table for details.

   Table 79 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeqDx v1.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Library Tube Barcode	Scan the library tube barcode.
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet, and then select Next Steps to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.

- Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

> The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.

6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.

Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1).

> Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)

This protocol contains a single fully automated step: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS (refer to Review Run Data).

Automations

The NovaSeqDx Run (NovaSeqDx v1.1) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) Package include a Set Next Steps automation configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step. You can use this automation to override the default next step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen. To make sure that the Lane Number displays correctly, do not disable or modify this automation.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics displayed on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global custom fields listed. Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.

1. When setting up a run on the NovaSeq 6000Dx instrument, NVOS sends a request for the run recipe.
   a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step.
   b. Clarity LIMS sends a JSON response to NVOS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).
2. When the run starts, NVOS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates the kit and enables on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVOS sends one of the following run status requests:

- RunCompletedSuccessfully
- RunEndedByUSer
- RunErroredOut

The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.

4. After primary analysis completes, NVOS sends a request containing the parsed run metrics. NVOS sends a request only when the run completes successfully. However, the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following:
   a. Records the metrics into the fields on file placeholder outputs in Clarity LIMS.
   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.

   > *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq 6000Dx run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Worker*
- *Troubleshooting Automation* in the API

If an error occurs that does not provide direction on how to proceed, (eg, the error is related to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step) review the log file information. For more details, refer to the *Logging* on page 168 section.

If the automated run step starts, but does not complete, do as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.

For Research Use Only. Not for use in diagnostic procedures.

- Search for the step in Clarity LIMS. You can use the Library Tube or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeqDx Standard or NovaSeqDx Xp run.

2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging on page 168*.
3. Contact the Clarity LIMS support team. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1) step, the Sequencer API writes a detailed log file to `/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`.

Log messages include the Library Tube ID and Flow Cell ID whenever the messages are related to a sequencing run-related request. In the Clarity LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most of the log messages for this request. However, the LIMS ID of the file must be known in order to retrieve all messages related to the file download. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (which can also be found in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2021-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell
Id=RM123DSXX] LimsApiLookupUtil : Searching for containers with name 'NV1234567-
LIB' or 'RM123DSXX'
....
2021-06-19 21:35:27.158 INFO --- [] FileService : Successfully retrieved file
'NV1234567-LIB.csv' with LIMS ID 40-51 through the API.
```

NovaSeq 6000Dx Integration v1.1 Installation

The Illumina NovaSeq 6000Dx Integration v1.1 supports the integration between Clarity LIMS (v5.1 or later) and the NovaSeq 6000Dx instrument. The integration includes the following changes:

- Updates to the NovaSeq 6000Dx library tube and flow cell barcodes that are accepted by the workflow.
- Fixes to the Denial of Service (CVE-2022-22970) and Integer Overflow (CVE-2022-22976) vulnerabilities.

This document provides instructions for installing NovaSeq 6000Dx Integration v1.1 and describes the components that are installed in the default configuration.

Integration Overview

Illumina NovaSeq 6000Dx Integration v1.1 includes the following features and functionality:

- Preconfigured NovaSeqDx v1.1 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeqDx v1.1)
  - NovaSeqDx Standard (NovaSeqDx v1.1) (supports the loading of pooled libraries into a library tube and the IVD sequencing run for the S2 and S4 flow cells)
  - NovaSeqDx Xp (NovaSeqDx v1.1) (supports individual lane loading on the NovaSeq 6000Dx)
  - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)
- Automated generation of the v2 sample sheet. This file is automatically uploaded to the sequencing instrument through the Sequencer API and is used to set up the run.
- Automated validation of run setup information. This information is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) through the Sequencer API. It is used to create the run recipe and initiate the run.
- Automated tracking of the following NovaSeq 6000Dx sequencing run information, and parsing of run statistics into Clarity LIMS:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.0 workflow used for validation purposes. This workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.0 workflow. For more information, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Prerequisites

Prerequisite 1: Illumina Preset Protocols (IPP) v2.5

The Illumina NovaSeq 6000Dx Integration Package v1.1 depends on the configuration provided in Illumina Protocols (IPP) v2.5.

The installation procedure provided in this document includes steps that install the following IPP configurations on the server used for the NovaSeq 6000Dx integration installation:

- QC Protocols Base configuration
- NovaSeqDx configuration
- Library Prep Validation configuration (optional, but recommended)

For details on IPP v2.5 installation and configuration, refer to the *Illumina Preset Protocols* documentation.

Prerequisite 2: Proxy Update (Illumina Cloud Hosted Installation Only)

The Illumina cloud hosted installation configures an additional include directive for `/etc/httpd/conf.d/clarity.conf` in the proxy configuration. Additional proxy configuration files for the Sequencer API service are expected to be placed in the `/etc/httpd/conf.d/clarity` folder.

Prerequisite 3: Secret Utility Configuration

If Clarity LIMS Secret Utility is not installed or configured, use the following information to configure Secret Utility:

Installation on a hosted system with Clarity LIMS (v5.4 or later)

The Clarity LIMS installation tooling configures this installation. No additional configuration is necessary.

Installation on Clarity LIMS (v5.3 or later)

The installation includes the following components:

- Tenant DB Password
- Clarity DB Password
- FTP password
- LDAP manager password (if LDAP is enabled)
- LabLink DB password (for Clarity LIMS v5.3 LabLink only)
- Reporting DB password (if installed)
- RabbitMQ password

For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

Sequencer API RPM Installation Components

NovaSeq 6000Dx Integration v1.1 is distributed as the BaseSpaceLIMS-sequencer-api RPM package. This package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following files and scripts:

- Sequencer API WAR file
- `application.yml` configuration file
- `configure_sequencer_api_proxy.sh` configuration script
- `configure_sequencer_api_env.sh` configuration script
- `configure_sequencer_api_application.sh` configuration script

Sequencer API WAR

The RPM installs the Sequencer API WAR file into the same Tomcat container as Clarity LIMS. The WAR file is installed to the following location:
`/opt/gls/clarity/tomcat/current/webapps/Illumina#Sequencer#v2##2.5.0.0.war`

The version number can differ.

The WAR file is deployed automatically when Clarity LIMS launches. Because the RPM installs a new WAR file, Clarity LIMS is automatically stopped during installation of the RPM. Restart Clarity LIMS before installing the NovaSeq and Library Prep Validation workflow configuration from the IPP.

Configuration File

The `application.yml` configuration file is installed to the following location:

`/opt/gls/clarity/extensions/sequencer-api/application.yml`

The file properties are configured with a script during the installation process.

For a complete list of all properties included in the `application.yml` file, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.

Configuration Scripts

The scripts in the following table are installed to the following location:

`/opt/gls/clarity/config`

During installation, the RPM runs these scripts as they are needed.

Script Name	User	Description
configure_sequencer_api_proxy.sh	root	Adds configuration to the proxy to allow communication with the Sequencer API after Tomcat has been started. Run this script in the following scenarios: • When the Sequencer API is first installed. • When reconfiguring the Clarity LIMS proxy. This process happens until a version of Clarity LIMS that includes the necessary configuration files from `/etc/httpd/clarity/*.conf` is available. Not required for Illumina cloud hosted installations.
configure_sequencer_api_env.sh	root	Adds Secret Management setting into the Clarity LIMS Tomcat configuration. Run this script when the Sequencer API is first installed on a Secret Util-enabled Clarity LIMS.

For Research Use Only. Not for use in diagnostic procedures.

Script Name	User	Description
configure_sequencer_api_application.sh	glsjboss	• Configures the installed `application.yml` file. • Sets the Clarity LIMS URL and the key to use when signing access tokens. Run this script when the Sequencer API is first installed. **!** If you run the script multiple times, the script reconfigures each setting to its default. The only exception is the signing key. For this setting, you are asked if you want a reset. If the reset is done, all previously issued tokens are no longer valid.

Installation Steps

NovaSeq 6000Dx Integration v1.1 supports RedHat Enterprise Linux and CentOS up to v7.9. Use v7.9 due to mitigate security risks. CentOS v6 is not supported.

If running the sequencing service and Automation Worker on the same instance, the instance must also be running a supported version of the Linux operating system.

[Optional] Install QC Protocols

If you are using PhiX control, install the base configuration of the QC Protocols from IPP as follows.

1. Log in as the root user on the server being used to install the integration.
2. Use the following yum command to install the IPP RPM:

```
yum install BaseSpaceLIMS-Illumina-Preset-Protocols --enablerepo=<< repo name info from support >>
```

   The `--enablerepo` command-line argument must be included to enable the repo. The Illumina Support team can provide you with the repo file with the appropriate naming convention.
3. Enter `y` to confirm that you want to proceed with the RPM and package installation.
4. Make sure that NGS Extension Package v5.22 is installed.
   If this package is not installed, you must install it or upgrade the existing package.
5. As the glsjboss user, install the `QC_Protocols.qc-protocols` configuration from the following location:

```
/opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install QC_
Protocols.qc-protocols.
```

For information on IPP installer commands, parameters, and options, refer to *Illumina Preset Protocols Integration v2.5 Installation and Configuration* in the *Illumina Preset Protocols* documentation.

Install Sequencer API

Install the Sequencer API as follows.

1. On the Clarity LIMS server, log in as the root user.
2. Use the following yum command to install the RPM:

```
yum install BaseSpaceLIMS-sequencer-api --enablerepo=< repo name info from
support >
```

   The `--enablerepo` command-line argument must be included to enable the repository. The Illumina Support team can provide you with the repo file with the appropriate naming convention.

3. Enter `y` to confirm that you want to proceed with the RPM installation.
4. If necessary, install the Secret Utility Package.
   For more information on this package, refer to *Prerequisite 3: Secret Utility Configuration* on page 170.
5. As the glsjboss user, run `configure_sequencer_api_application.sh` from the following location:

```
bash /opt/gls/clarity/config/configure_sequencer_api_application.sh
```

6. Enter values for the presented as follows.
   You can also press Enter to accept the default values in the `application.yml` configuration file. For more information about the `application.yml` properties, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.
   - Would you like to use the apiuser user for communication with Clarity? [Y]
   - Enter required value for Token Expiry (hours) [88]
7. Update the Clarity LIMS proxy for the Sequencer API as follows.
   - For an on-premise system, run the following command:

```
bash /opt/gls/clarity/config/configure_sequencer_api_proxy.sh
```

   - For an Illumina cloud hosted system, make sure that the proxy has been updated as follows. Place the `sequencer-api.include` file in `/etc/httpd/conf.d/clarity`.

```
<Location "/Illumina/Sequencer/v2">
ProxyPass ajp://localhost:9009/Illumina/Sequencer/v2
ProxyPassReverse ajp://localhost:9009/Illumina/Sequencer/v2
</Location>
```

8. Update the Clarity LIMS Tomcat configuration as follows.

a. Make sure that Secret Utility is installed and configured. For more information, refer to *Prerequisite 3: Secret Utility Configuration* on page 170.

b. Run the following command to add the Secret Utility configuration to Clarity LIMS:

```
bash /opt/gls/clarity/config/configure_sequencer_api_env.sh
```

> This script modifies `/opt/gls/clarity/tomcat/current/bin/setenv.sh` for Clarity LIMS Tomcat to load the Secret Utility environment variable file (`/etc/profile.d/claritysecret.sh`) during startup.

c. Use the following command to Start Clarity LIMS:

```
/opt/gls/clarity/bin/run_clarity.sh start
```

Install NovaSeqDx and Library Prep Validation Workflow Configuration

Install the NovaSeqDx and Library Prep workflow configuration from IPP as follows.

1. As the glsjboss user, run the following command to install the NovaSeq 6000Dx v1.1 workflow configuration:

```
bash /opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.novaseqdx-v1.1
```

> The installer validates the import of the workflow and provides the Warning/Error details in STDOUT, which allows you to either proceed with the import or cancel it.

2. [Optional] Run the following command to install the Library Prep Validation v2.3.0 workflow:

```
/opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.Library-Prep-Validation-v2.3
```

This step is optional, but recommended. The Library Prep Validation v2.3.0 workflow allows you to validate the NovaSeqDx v1.1 workflow.

Check Sequencer API

Make sure that the Sequencer API is working as follows.

1. Visit `https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/sequencing-run/login`. This page returns the following URL string:

```
https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/oauth/authorize?client_
id=illumina_sequencer&amp;redirect_uri=../sequencer_login&amp;response_
type=token
```

2. Copy and paste the URL string into the browser. The Clarity LIMS Sign In page opens.
3. Enter sign in credentials.
4. Select Sign In. A Successfully Authenticated message displays.

[Optional] Configure `application.yml` Properties

The installer script configures the `application.yml` configuration properties by prompting for values. You can also configure these properties by editing the `application.yml` file, and then restarting Clarity LIMS. Configuring these properties is optional.

For more information, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.

Workflows, Protocols, and Steps Installed

NovaSeq 6000Dx Integration v1.1 includes the workflows, protocols, and steps listed in the following table.

Package	Workflow	Protocols	Steps
IPP v2.5	NovaSeqDx v1.1	Run Format (NovaSeqDx v1.1)	1. Define Run Format (NovaSeqDx v1.1)
		NovaSeqDx Standard (NovaSeqDx v1.1)	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.1) 2. Dilute and Denature (NovaSeqDx v1.1)
		NovaSeqDx Xp (NovaSeqDx v1.1)	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.1) 2. Dilute, Denature, and ExAmp (NovaSeqDx v1.1) 3. Load to Flowcell (NovaSeqDx v1.1)
		AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)
IPP v2.5	Library Prep Validation v2.3.0	Library Prep Validation v2.3.0	1. Library Prep Validation v2.3.0

For detailed descriptions of the steps and automations included in each protocol, and details on other components in the configuration, refer to *NovaSeq 6000Dx Integration v1.1 Configuration and User Interaction* on page 90.

For instructions on using the Library Prep Validation v2.3.0 protocol, refer to *NovaSeq 6000Dx Integration v1.1 Validation and Troubleshooting* on page 148.

Instrument Software

The NovaSeq 6000Dx instrument software includes the following components:

- NovaSeq 6000Dx Operating Software (NVOS)—Contains the user interface for setting up the sequencing run. Responsible for controlling the instrument and acquiring the images.
- Real-Time Analysis v3 (RTA3)—Takes the images generated by the first module, processes, and analyzes them. Makes sure that data files are created and copied to the final destination folder.
- Sequencing Analysis Viewer (SAV)—Displays the important quality metrics generated by the RTA3 software.
- NovaSeq 6000Dx recipes—Provides system operation instructions for use with NovaSeq 6000Dx reagent kits for SP, S1, S2, and S4 flow cells.
- Universal Copy Service—Copies output files to destinations such as final destination folder and/or BaseSpace Sequence Hub (when the instrument is configured for use with BaseSpace Sequence Hub).

Instrument Integration Configuration

For the NovaSeq 6000Dx API integration to work, the instrument must be able to communicate with Clarity LIMS through the API. Complete the following steps to configure the NVOS and confirm that you can access Clarity LIMS from the instrument.

1. Launch NVOS and wait for the initialization process to complete.
2. On the NVOS Instrument Settings page, do as follows.
   a. Select the Global Settings tab.
   b. Under Instrument Mode, select one of the following modes:
      - Allow users to switch between IVD and RUO
      - IVD Only
      - RUO Only
3. If you selected IVD Only instrument mode, select the IVD Settings tab and complete the following steps:
   a. Configure Run Setup as follows.
      - Select the Select runs from the LIMS server option.
      - Enter the Clarity LIMS URL (eg, https://yourserver.claritylims.com).
   b. [Optional] Under Output Location, enter the output folder location. You can also specify the output folder location when setting up a run in NVOS.

4. If you selected RUO Only instrument mode, select the RUO Settings tab and complete the following steps:
   a. Configure Run Setup as follows.
      - Select the Select runs from the LIMS server option.
      - Enter the Clarity LIMS URL(eg, https://yourserver.claritylims.com).
   b. Configure Default Work Type as follows.
      - [Optional] If selection support between NovaSeq Xp or NovaSeq Standard is required for the workflow, select the Enable workflow selection checkbox.
      - Select the required default workflow type: NovaSeq Standard or NovaSeq Xp.
   c. [Optional] Configure Output Location as follows.
      - [Optional] Enter the output folder location. You can also specify the output folder location when setting up a run in NVOS.
      - [Optional] To upload and store run data in the cloud server, select the BaseSpace Sequence Hub checkbox. Select a Configuration option (Run Monitoring and Storage or Run Monitoring Only) and select your Hosting Location from the drop-down list.
5. Select Save to complete the configuration.
6. On the NVOS home page, you can now select Sequence to log into Clarity LIMS and start a run.

NovaSeq 6000Dx Integration v1.1 Manual Upgrade

NovaSeq 6000Dx Integration Package v1.1 includes the NovaSeqDx Sequencing v1.1 workflow that is required for the integration to work.

If you do not want to upgrade your existing NovaSeqDx Sequencing workflow to the latest workflow in IPP, update the workflow configuration manually.

Update Calculate Volumes Automation on Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) Step

Update the Calculate Volumes automation on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, search for the Calculate Volumes automation for the NovaSeqDx Standard (NovaSeqDx v1.0) step.
3. Change values in the existing command line as follows.
   Changes to the existing command line are in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} -t true -log {compoundOutputFileLuid1} \
```

```
script:evaluateDynamicExpression \
-h false \
-exp 'step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: +
1' \
script:evaluateDynamicExpression \
-h false \
-exp 'step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ?
0 : step.::% PhiX (2.5nM) Spike-In::; if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S2::) {

NovaSeq 6000Dx Integration v1.1 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeqDx Integration Package version 1.1.

Compatibility

This version of the integration package is compatible with the following software:

- BaseSpace Clarity LIMS v5.1 and later
- NGS Extensions Package v5.22 and later
- Illumina Preset Protocols (IPP) v2.5.0 and later
- NovaSeq 6000Dx Operating Software (NVOS) v2.3.1

New Features

Features provided with this release of the integration package are as follows.

- Updates the Validate Flowcell Barcode automation (in the Load to Flowcell step of the NovaSeq Xp protocol) to support future flow cell barcode formats.
- Fixes Denial of Service (CVE-2022-22970) and Integer Overflow (CVE-2022-22976) vulnerabilities.

Defects Fixed

The following Calculate Volumes automation script values are now in sync with the *NovaSeq 6000 Denature and Dilute Libraries Guide*:

- PhiX
- NaOH
- Tris-HCl
- Bulk pool volume

The Validate Library Tube Barcode automation (in the Dilute and Denature step of the NovaSeqDx Standard protocol for Dx run mode) correctly validates Dx library tubes.

Known Issues

None

NovaSeq 6000Dx Integration v1.0 Configuration and User Interaction

The Illumina NovaSeq 6000Dx Integration Package v1.0 supports the integration of Clarity LIMS to Illumina NovaSeq 6000Dx instruments. This integration supports Clarity LIMS v5.1 and later.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000Dx Integration, refer to *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

The configuration provided in this integration has been established to support NovaSeq 6000Dx lab processes. Any configuration changes to protocols or workflows—including renaming protocols, steps, and fields—could break the process.

Overview

The integration includes the following features:

- Preconfigured NovaSeqDx v1.0 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeqDx v1.0)
  - NovaSeqDx Standard (NovaSeqDx v1.0) (supports the loading of pooled libraries into a library tube)

  - NovaSeqDx Xp (NovaSeqDx v1.0) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)
- Automated generation of v2 sample sheet. This file is automatically uploaded to the instrument via the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
  - [Optional] Preconfigured Library Prep Validation v2.2.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeqDx v1.0 workflow. For more information, refer to *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244. The Library Prep Validation v2.2.0 workflow is available in the Illumina Preset Protocols (IPP) v2.4 package.

Prerequisites and Assumptions

Samples enter the NovaSeqDx v1.0 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000Dx Integration Package v1.0 includes the following workflows:

- NovaSeqDx v1.0
- Library Prep Validation v2.2.0 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 80 NovaSeq 6000Dx Integration Package v1.0 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
	Library Prep Validation v2.2.0 Workflow	
Library Prep Validation v2.2.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeqDx v1.0) protocol. The protocol contains a single step - Library Prep Validation v2.2.0. After this step, a routing script sends the samples to the first step of the NovaSeqDx v1.0 workflow - Define Run Format (NovaSeqDx v1.0).	1. Library Prep Validation v2.2.0
	NovaSeqDx v1.0 Workflow	
Run Format (NovaSeqDx v1.0)	Allows for the assignment of per sample values for the following properties: • NovaSeqDx Run Mode: Select either RUO or DX. • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity (nM): Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeqDx Standard or NovaSeqDx Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeqDx v1.0)

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeqDx Standard (NovaSeqDx v1.0)	Samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) protocol.	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) 2. Dilute and Denature (NovaSeqDx v1.0)
NovaSeqDx Xp (NovaSeqDx v1.0)	Samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.0) step determines the flow cell type. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) protocol.	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) 2. Dilute, Denature & ExAmp (NovaSeqDx v1.0) 3. Load to Flowcell (NovaSeqDx v1.0)
AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)

Validation Workflow

The Library Prep Validation v2.2.0 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Step Automations

The following table lists the step automations included in the NovaSeq 6000Dx v1.0 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Table 81 NovaSeq 6000Dx v1.0 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeqDx v1.0)	1. Define Run Format (NovaSeqDx v1.0)	Routing Script Set Next Steps
2. NovaSeqDx Standard (NovaSeqDx v1.0)	1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Single NovaSeqDx Run Mode Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute and Denature (NovaSeqDx v1.0)	Routing Script Validate Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeqDx Xp (NovaSeqDx v1.0)	1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute, Denature, and ExAmp (NovaSeqDx v1.0)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeqDx v1.0)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)	1. AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)	Update Lane Number Set Next Steps (Not used. By default, the Sequencer API determines this functionality. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Terminology

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Protocol 1: Run Format (NovaSeqDx v1.0)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeqDx Standard (NovaSeqDx v1.0) or the NovaSeqDx Xp (NovaSeqDx v1.0) protocol.

This protocol contains one step: Define Run Format (NovaSeqDx v1.0).

Step 1. Define Run Format (NovaSeqDx v1.0)

Step input: Normalized Template Plate (NTP, normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

For Research Use Only. Not for use in diagnostic procedures.

- Checks NovaSeqDx Run Mode, Loading Workflow Type, and Flowcell Type. Only the NovaSeq Standard with the S2/S4 flow cell is supported for the NovaSeqDx Run Mode:

```
if (input.::NovaSeqDx Run Mode:: == ::DX::) {
    if (input.::Loading Workflow Type:: == ::NovaSeq Xp::) {
        fail(::Invalid option selected. NovaSeq Standard shall be selected for DX
        mode.::);
    };
    if (input.::Flowcell Type:: == ::SP:: || input.::Flowcell Type:: == ::S1::) {
        fail(::Invalid option selected. Only S2 or S4 flowcell shall be selected
        for DX mode.::);
    };
};
```

- Calculates the Minimum Molarity with the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares the Normalized Molarity value of each sample with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, this sets the Loading Workflow Type of the sample to [Remove from workflow]. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
    input.::Warning:: = ::The Normalized Molarity is too low.::;
    input.::Loading Workflow Type:: = ::[Remove from workflow]::;
} else {
    input.::Warning:: = ::n/a::
}
```

At this point, the following options are available:

- Correct the NovaSeqDx Run Mode and Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeqDx v1.0 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeqDx v1.0 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step.

Default automation command line is as follows.

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}

```

Master Step Fields

There are four fields defined on the Define Run Format (NovaSeqDx v1.0) master step.

The following table lists field configuration details.

Table 82 Define Run Format (NovaSeqDx v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text	• Required: No • Read Only: No	None

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• SP • S1 • S2 • S4
Instruction	Text	• Required: No • Read Only: Yes	• Default: Add Flowcell Type, Loading Workflow Type, and NovaSeqDx Run Mode
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeqDx v1.0) step.

Table 83 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Final Loading Concentration (pM)	Numeric Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• 225 • 400 • Decimal Places Displayed: 0
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Normalized Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
NovaSeqDx Run Mode	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• DX • RUO
Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Warning	Text Dropdown	• Required: No • Read Only: Yes • Custom Entries: Yes	• The Normalized Molarity (nM) is too low. • Not applicable

User Interaction

Refer to Run Define Run Format (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.0)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeqDx Run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) protocol.

This protocol contains the following two steps:

- Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0)
- Step 2: Dilute and Denature (NovaSeqDx v1.0)

Step 1: Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Single NovaSeqDx Run Mode

The Validate Single NovaSeqDx Run Mode automation is triggered on entry of the step. The following automation checks that all input samples have the same NovaSeqDx Run Mode assigned:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_same_analyte_udf_value_for_all_inputs \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-f 'NovaSeqDx Run Mode'"
```

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when you select the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (ul):: *= 0.8
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (ul):: *= 0.8
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150
+ 30;
step.::PhiX Volume (ul):: *= 1.1
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310
+ 30;
step.::PhiX Volume (ul):: *= 2.1
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, this automation completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field of the sample.

For Research Use Only. Not for use in diagnostic procedures.

2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: +
input.::Adjusted Per Sample Volume (ul)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::
} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value a calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type.

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S1:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ;
output.::NaOH Volume (ul):: = 25 ;
output.::Tris-HCl Volume (ul):: = 25
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
output.::Volume of Pool to Denature (ul):: = 150 ;
output.::NaOH Volume (ul):: = 37.50 ;
output.::Tris-HCl Volume (ul):: = 37.50
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
output.::Volume of Pool to Denature (ul):: = 310 ;
output.::NaOH Volume (ul):: = 77.50 ;
output.::Tris-HCl Volume (ul):: = 77.50
```

For Research Use Only. Not for use in diagnostic procedures.

```
}
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download in the Files section of the Record Details milestone in the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
      Bulk_Pool1.csv \
      -o 1.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
      Bulk_Pool2.csv \
      -o 2.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_
      Bulk_Pool3.csv \
      -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the Dilute and Denature (NovaSeqDx v1.0) step in the protocol:

```
nextStep = ::ADVANCE::
```

The following automation copies the NovaSeqDx Run Mode values from the step inputs to the step outputs:

```
output.::NovaSeqDx Run Mode:: = input.::NovaSeqDx Run Mode::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeqDx v1.0) step. The following table lists configuration details.

Table 84 Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric	Required: No Read Only: No	Range = 0–100 Decimal Places Displayed: 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Number of Flowcells to Sequence	Numeric	Required: Yes Read Only: No	Range = 1–10 Decimal Places Displayed: 0
Minimum Per Sample Volume (µl)	Numeric	Required: Yes Read Only: No	Decimal Places Displayed: 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step.

Table 85 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
RSB Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Volume of Pool to Denature (µl) (Used in Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step only. Displays on Record Details screen and in the generated CSV file.)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0

User Interaction

Refer to Run Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Step 2: Dilute and Denature (NovaSeqDx v1.0)

In this step, the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB) denatures and dilutes pooled samples. Manually place the pooled samples into the library tube for the NovaSeqDx Run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the following barcode masks:
  - DX mode: [A-Z]{2}[0-9]{7}-[A-Z]{5}
  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}

```
if ((input.::NovaSeqDx Run Mode:: == ::DX:: && !output.container.name.matches(::
[A-Z]{2}[0-9]{7}-[A-Z]{5}::)) || (input.::NovaSeqDx Run Mode:: == ::RUO:: &&
!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::))) {
fail(::Invalid Library Tube Barcode. Please verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

Triggered by a button on the Record Details screen, this automation completes the following actions:

> The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit. If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. The parameters are as follows. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000Dx Run* on page 231.
  - Experiment Name only contains alphanumeric, dash, or underscore characters. Spaces are not permitted.

  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values as follows.
  - If Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - If Paired End = False, Read 2 Cycles must be zero.

```
if (step.::Paired End::.toBoolean()) {
    if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
        fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
        End is True.::)
    }
} else {
    if (step.::Read 2 Cycles:: != 0) {
        fail(::Read 2 Cycles must be 0 if Paired End is False.::)
    }
};
```

- Checks the Flowcell field value as follows.

For Research Use Only. Not for use in diagnostic procedures.

  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowc ell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to contain only Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Generates the V2 sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 230.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeqDx v1.0 workflow, and queues them for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.

The default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid1} script:changeWorkflow \
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeqDx v1.0' \
--STEP 'AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

There are 19 fields defined on the Dilute and Denature (NovaSeqDx v1.0) step. These fields are required for sample sheet and JSON file generation.

The following table lists field configuration details.

Table 86 Dilute and Denature (NovaSeqDx v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text	Required: No Read Only: No	
BaseSpace Sequence Hub Configuration	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Not Used Run Monitoring Only Run Monitoring and Storage
Custom Recipe Path	Text	Required: No Read Only: No	
Experiment Name	Text	Required: Yes Read Only: No	

Field Name	Field Type	Options	Additional Options and Dropdown Items
Index Read 1	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Output Folder	Text	Required: Yes Read Only: No	
Override Cycles	Text	Required: No Read Only: No	
Paired End	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 1–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycle	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Run Mode (Not displayed in user interface)	Text Dropdown	Required: No Read Only: Yes Custom Entries: No	Presets • SP • S1 • S2 • S4
Use Custom Index Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 2 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Recipe	Toggle Switch	Required: Yes Read Only: No	Default • No

Field Name	Field Type	Options	Additional Options and Dropdown Items
Validation Script	Multiline Text	Required: Yes Read Only: Yes	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Required: No Read Only: Yes	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail
(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) } }; if (input.::Flowcell Type:: != ::SP:: &&
```

```
step.::Read 1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: &&
step.::Read 2 Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151
if it is not SPrime Flowcell::) }; if (step.hasValue(::Analysis Software
Version::) && !step.::Analysis Software Version::.matches(::^(\\d+)
(\\.\\d+)*$::)) { fail(::Analysis Software Version contains prohibited
characters. Allowed characters are 0-9 and period. It shall start and end with
numbers and separated by single period e.g. 3.8.4::) }; if (step.hasValue
(::Override Cycles::) && !step.::Override Cycles::.matches(::[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::) }; nextStep =
::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeqDx v1.0) step.

Table 87 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Dilute and Denature (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.0)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeqDx v1.0) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0)
- Step 2: Dilute, Denature, and ExAmp (NovaSeqDx v1.0)
- Step 3: Load to Flowcell (NovaSeqDx v1.0)

Step 1: Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type:

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30 + 30;
step.::PhiX Volume (ul):: *= 2.2;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, this automation calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::) {
output.::RSB Volume (ul):: = 0
}
else {
    output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
    Sample Volume (ul)::
} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the Dilute, Denature, and ExAmp (NovaSeqDx v1.0) step.

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
    script:driver_file_generator \
       -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
       Pool.csv \
       -o {compoundOutputFileLuid0}.csv \
    script:driver_file_generator \
       -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
       Pool2.csv \
       -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

For Research Use Only. Not for use in diagnostic procedures.

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step.

Table 88 Make Bulk Pool for NovaSeq Xp (NovaSeqDx v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric	• Required: No • Read Only: No	• Range From: 0 to 100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Minimum Per Sample Volume (µl)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Lanes to Sequence	Numeric	• Required: Yes • Read Only: No	• Decimal Places Displayed: 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step.

Table 89 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Step 2: Dilute, Denature and ExAmp (NovaSeqDx v1.0)

In this step, the addition of DPX, NaOH, Tris-HCl, and RSB denatures and dilutes pooled samples. Manually create working pools based on the number of lanes that you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number (choose how many working pools to create per bulk pool)

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4). This automation also checks that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
```

```
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (µl):: = 18 ;
output.::NaOH Volume (µl):: = 4.50 ;
output.::Tris-HCl Volume (µl):: = 4.50 ;
step.::DPX1 Volume (µl):: = 126 ;
step.::DPX2 Volume (µl):: = 18 ;
step.::DPX3 Volume (µl):: = 66 ;
output.::Mastermix per Lane (µl):: = 63
};

if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4.50;
output.::Tris-HCl Volume (µl):: = 4.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
```

```
output.::BP Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5.50;
output.::Tris-HCl Volume (µl):: = 5.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7.50;
output.::Tris-HCl Volume (µl):: = 7.50;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. This file contains information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the Dilute, Denature & ExAmp (NovaSeqDx v1.0) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool.csv \
      -o {compoundOutputFileLuid0}.csv \
   script:driver_file_generator \
      -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_
      Working_Pool2.csv \
      -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are three fields defined on the Dilute, Denature & ExAmp (NovaSeqDx v1.0) step. A script sets these field values. They are not editable while running the step.

The following table lists field configuration details.

Table 90 Dilute, Denature & ExAmp (NovaSeq v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX2 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX3 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature & ExAmp (NovaSeqDx v1.0) step.

Table 91 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
NaOH Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

User Interaction

Refer to Run Dilute, Denature & ExAmp (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Step 3: Load to Flowcell (NovaSeqDx v1.0)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeqDx run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.

- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.

The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Z0-9]{5}DRX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Z0-9]{5}DRX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-
Z0-9]{5}DMX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

```
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Z0-9]{5}DSX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be 0.
  - When Workflow Type = Single Index, Index Read 1 must be greater than 0 and Index Read 2 must be 0.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than 0.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::)
}
```

For Research Use Only. Not for use in diagnostic procedures.

```
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - When Paired End = True, both Read 1 Cycles and Read 2 Cycles must be greater than 0.
  - When Paired End = False, Read 2 Cycles must be 0.

```
if (step.::Paired End:.toBoolean()) {
   if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
      fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired
      End is True.::)
   }
} else {
   if (step.::Read 2 Cycles:: != 0) {
      fail(::Read 2 Cycles must be 0 if Paired End is False.::)
   }
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If the value is greater than 151, an error message displays.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validate Analysis Software Version

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Checks Override Cycles field value. This field contains only Y, N, I, U, 0–9, and semicolon characters.

For Research Use Only. Not for use in diagnostic procedures.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Sets the next step for samples to ADVANCE, advancing them to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 230

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeqDx_BCL2FASTQ_
Samplesheet_v2.csv \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}
```

Master Step Fields

The following table lists the field configuration details for the fields defined on the Load to Flowcell (NovaSeqDx v1.0) step.

Table 92 Load to Flowcell (NovaSeqDx v1.0) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text	• Required: No • Read Only: No	
BaseSpace Sequence Hub Configuration	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage

Field Name	Field Type	Options	Additional Options and Dropdown Items
Custom Recipe Path	Text	• Required: No • Read Only: No	
Experiment Name	Text	• Required: Yes • Read Only: No	
Index Read 1	Numeric Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Library Tube Barcode	Text	• Required: Yes • Read Only: No	
Output Folder	Text	• Required: Yes • Read Only: No	
Override Cycles	Text	• Required: No • Read Only: No	
Paired End	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• True • False

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 1 Cycles	Numeric Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Numeric Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 0 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Run Mode (not displayed in user interface)	Text Dropdown	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4
Use Custom Index Read 1 Primer	Toggle Switch	• Required: No • Read Only: No	• Default: None Set
Use Custom Read 1 Primer	Toggle Switch	• Required: No • Read Only: No	• Default: None Set

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Read 2 Primer	Toggle Switch	• Required: No • Read Only: No	• Default: None Set
Use Custom Recipe	Toggle Switch	• Required: Yes • Read Only: No	• Default: No
Validation Script	Multiline Text	• Required: Yes • Read Only: Yes	• Default value provided in the drop-down section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	• Required: No • Read Only: Yes	• Default: GenerateFASTQ
Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if (step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
```

```
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) }}; if (input.::Flowcell Type:: != ::SP:: && step.::Read
1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151 if it is
not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 2
Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151 if it is not
SPrime Flowcell::) }; if (step.hasValue(::Analysis Software Version::) &&
!step.::Analysis Software Version::.matches(::^(\\d+)(\\.\\d+)*$::)) { fail
(::Analysis Software Version contains prohibited characters. Allowed characters
are 0-9 and period. It shall start and end with numbers and separated by single
period e.g. 3.8.4::) }; if (step.hasValue(::Override Cycles::) &&
!step.::Override Cycles::.matches(::[YNIU0-9;]+::)) { fail(::Override Cycles
contains prohibited characters. Allowed characters are: Y, N, I, U, 0-9 and ;.
Example: N1Y150;I8;I7N1;Y141U10.::) }; step.::Settings Header:: = step.hasValue
(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::
[Settings]:: : ::::; nextStep = ::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeqDx v1.0) step.

Table 93 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured in Analyte on Derived Sample			
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

For more information, refer to the Run Load to Flowcell (NovaSeqDx v1.0) step section in *NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting* on page 244.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)

This final protocol contains one fully automated step, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0).

This step is fully automated. Do not add samples to the Ice Bucket or start the step manually. If steps are manually started, the sequencing service does not update the samples correctly.

Step 1: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)

Step input: Library tube from NovaSeqDx Standard or flow cell from NovaSeqDx Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq 6000Dx instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configure Autocomplete Properties* on page 242.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following table shows the master step fields that are configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.

Table 94 Clarity LIMS Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Current Cycle	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
Current Read	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
Firmware Version	Text	• Required: No • Read Only: Yes	
Flow Cell Expiration Date	Date	• Required: No • Read Only: Yes	
Flow Cell ID	Text	• Required: No • Read Only: Yes	
Flow Cell Lot Number	Text	• Required: No • Read Only: Yes	
Flow Cell Mode	Text	• Required: No • Read Only: Yes	
Flow Cell Part Number	Text	• Required: No • Read Only: Yes	
Flow Cell Side	Text	• Required: No • Read Only: Yes	
Instrument Control Software Version	Text	• Required: No • Read Only: Yes	
Instrument ID	Text	• Required: No • Read Only: Yes	
Instrument Type	Text	• Required: No • Read Only: Yes	
Lane Counter	Numeric	• Required: No • Read Only: Yes	• Default: 1 • Hidden
Loading Workflow Type	Text	• Required: No • Read Only: Yes	
Output Folder	Text	• Required: No • Read Only: Yes	

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
RTA Version	Text	• Required: No • Read Only: Yes	
Run Completion Date	Text	• Required: No • Read Only: Yes	• Hidden
Run ID	Text	• Required: Yes • Read Only: Yes	
Run Status	Text	• Required: No • Read Only: Yes	
Sequencing Log	Multiline Text	• Required: No • Read Only: Yes	

Global Fields

The following table shows the global custom fields that capture the run metrics in Clarity LIMS.

Table 95 Custom Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% Aligned R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Aligned R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Bases >=Q30 R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Bases >=Q30 R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Error Rate R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Error Rate R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
% Phasing R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 3

Field Name	Field Type	Options	Additional Options and Dropdown Items
% Phasing R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 3
% Prephasing R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 3
% Prephasing R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 3
%PF R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
%PF R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Cluster Density (K/mm^2) R1	Numeric	• Required: No • Read Only: Yes	
Cluster Density (K/mm^2) R2	Numeric	• Required: No • Read Only: Yes	
Intensity Cycle 1 R1	Numeric	• Required: No • Read Only: Yes	
Intensity Cycle 1 R2	Numeric	• Required: No • Read Only: Yes	
Reads PF (M) R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Reads PF (M) R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Yield PF (Gb) R1	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Yield PF (Gb) R2	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeqDx v1.0 configuration provided in the Illumina Preset Protocols (IPP) Package v2.4 or later.
- All global configuration fields are configured on the Container entity.

- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If field names are changed in Clarity LIMS, they must also be changed through the run.metricUdfNames properties file in the `application.yml` file for the Sequencer API. All fields are configured to be visible on the Record Details screen for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step (in the Sample Details table). For more information, refer to the application.yml Properties section of *Components Installed* on page 236.

These global custom fields are configured on the Container entity, visible on each input, and must not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeqDx Operating Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run. This step is either Dilute and Denature (NovaSeqDx v1.0) in the NovaSeqDx Standard protocol or Load to Flowcell (NovaSeqDx v1.0) in the NovaSeqDx Xp protocol. This step places samples on the library tube or flow cell that is loaded in the NovaSeqDx instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one sample sheet file for use with bcl2fastq v2.20 downstream analysis. This file is in the comma-separated values (CSV) format.

The sample sheet is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeqDx.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The following step custom fields that display in the Step Details area of the Record Details screen control the sample sheet content:

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Index 1 Cycles
- Index 2 Cycles
- Analysis Software Version

- Override Cycles

For detailed information on the following items, refer to the bcl2fastq2 *Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000Dx Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000Dx instrument.

User Authentication and Login

User authentication and login to the NovaSeqDx instrument is achieved with the getSequencerLoginURL endpoint (`/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq 6000Dx Operating Software (NVOS) with a URL for the Clarity LIMS login screen. The NVOS displays this screen to the user. Log in to authorize NVOS to use your account to access Clarity LIMS. This authorization is automatic.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact Clarity LIMS at `http://localhost:9080/clarity/`. The installation script sets the URL, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 236.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by redirecting to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeqDx to continue with run setup.
   - If authentication fails, the login screen does not change and a warning message displays. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000Dx of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The sequencing-run/recipe/NovaSeq 6000Dx endpoint consumes a POST request with a LibraryContainerId, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagents are provided by the NovaSeq 6000Dx.
   - LibraryContainerId and FlowCellId can match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 236.
3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVOS via the API. Then, the run receipt is generated.
   Note the following details:
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeqDx v1.0) or Load to Flowcell (NovaSeqDx v1.0) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq 6000Dx v1.0 configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each property corresponds to an entry in the recipe. The value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step is configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. If no matching output is found, or no file was attached to the

output, the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 236.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The sample sheet contents and the fields configured on the Dilute and Denature (NovaSeqDx v1.0) and Load to Flowcell (NovaSeqDx v1.0) steps control the contents of the run recipe.

Example of run recipe content is as follows.

```
{
"run_name": "NVOS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

> If no matching container is found, or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged, and the API cannot complete the step without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored, and a warning is logged during lot tracking.
3. The type of flow cell being used in the run determines the number of replicates for the step.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged, and the reagent is ignored.
   - You can look up existing reagent lots by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and step 2.
   - Name—Serial number in request.
   - Lot Number—Lot number in request.
   - Expiry—Expiry date in request.
   - Status—Active.

For Research Use Only. Not for use in diagnostic procedures.

If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.

6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 235.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 235.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Finds the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the user ends a sequencing run, the API call for Sequencing RunEndedByUser is received. The Sequencing Container matches the Information, and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000Dx Integration v1.0 is distributed as an RPM package, BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- The following configuration scripts:
  - `configure_sequencer_api_proxy.sh`
  - `configure_sequencer_api_env.sh`
  - `configure_sequencer_api_application.sh`

The NovaSeq 6000Dx v1.0 configuration is delivered through the Illumina Preset Protocols (IPP) Package v2.4. IPP Package v2.4 requires installation of NGS Extensions Package v5.22.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.22.0 is installed, the latest version is installed by default with the NovaSeq 6000Dx integration. For details, refer to *NovaSeq 6000Dx Integration v1.0 Release Notes* on page 264.
- If NGS Extensions Package v5.22.0 or later is already installed, upgrade is not forced or required.

NovaSeq 6000Dx Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for NovaSeqDx v1.0 API.
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMS Tomcat configuration to include Secret Util settings.
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API (NovaSeqDx v1.0 API) application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with Clarity LIMS.

`application.yml` Properties

The `application.yml` file is at `opt/gls/clarity/extensions/sequencing-api/`.

- All properties are configured automatically during installation. You can also configure properties after installation, by editing the `application.yml` file. If you make changes to the file, you must restart Tomcat.
- File properties represent all custom field names, both for recipe and run information.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, the Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 96 `application.yml` Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (configure_sequencer_api_application) prompts for this property.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that is used when signing/validating OAuth tokens. Changing this property invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq 6000Dx sequencing run step names for which the integration can find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line is indented to the same point and start with a dash (-). Default value: • AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)

novaseq.flowcells	List of supported NovaSeq 6000Dx flow cell types.
	• Type names exactly match the values used by the NVOS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default value:
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4`
	`"lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	- lotName: The name of the lot as it appears in the run started request.
	- kitName: The name of the corresponding reagent kit in Clarity LIMS that is used for lot tracking.
	• The name can differ in the NVOS request versus the Clarity LIMS configuration.
	Default value:
	`- lotName: "Buffer`
	`"kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to *Run Recipe Contents* section in *NovaSeq 6000Dx Run* on page 231. • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section in *NovaSeq Run* on page 583 • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file global custom field names to be used when recording run results. These are the fields that capture the run data. For more information, refer to *Global Custom Fields* section.
run.autoComplete	Determines whether the sequencing run step is completed automatically after parsing the run metrics on a run (refer to run.autoCompleteOnlyAtSuccess). Default value: true For more information, refer to the *Configure Autocomplete Properties* on page 242 section.
run.autoCompleteOnlyAtSuccess	Determines which of the following options are applicable to the sequencing run step: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true For more information, refer to the *Configure Autocomplete Properties* on page 242 section.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge

- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris-HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the following formats:
  - RUO mode: [A-Z]{2}[0-9]{7}-[A-Z]{3}
    Example: AB1234567-LIB
  - DX mode: [A-Z]{2}[0-9]{7}-[A-Z]{5}
    Example: AB1234567-LIBDX
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DRX[XY2357]
  - S2 flow cell: [A-Z0-9]{5}DMX[XY2357]
  - S4 flow cell: [A-Z0-9]{5}DSX[XY2357]
    Example: H1991DMXX

NVOS Configuration

For details on configuring the NovaSeq 6000Dx Operating Software (NVOS) for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

- On the steps that use the routing script (Define Run Format (NovaSeqDx v1.0) and Dilute and Denature (NovaSeqDx v1.0)):

  - The Next Step for all samples must be set to Remove from workflow. A script sets this value. The value must not change in the Assign Next Steps screen.
- In the protocol configuration screen, the following settings are required and must not be changed:
  - In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.

Configure Autocomplete Properties

The `application.yml` configuration file contains l the following properties:

- run.autoCompleteOnlyAtSuccess
- run.autoComplete

These properties determine the conditions under which the last step of the NovaSeq 6000Dx workflow, AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0), is automatically completed. The two scenarios for autocompletion of the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step are as follows.

- The step autocompletes only when the run status is RunCompletedSuccesfully (default behavior).
- The step autocompletes regardless of the run status.

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, the step must be completed manually in Clarity LIMS.

For the step to autocomplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enable/Disable autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccess property as required.
3. Save the file.

autoComplete Properties

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 97 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true	true	• Step automatically completes only if the sequencing run is successful. • If run is not successful, the step does not automatically complete, and the run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There must not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples. All other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542.
- Do not manually start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, the Validate Run Setup and Generate Sample Sheet button must be selected.

NovaSeq 6000Dx Integration v1.0 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq 6000Dx Integration Package v1.0.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeqDx v1.0 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeqDx v1.0) step to the NovaSeqDx Standard (NovaSeqDx v1.0) or NovaSeqDx Xp (NovaSeqDx v1.0) step.
  - Automated generation of v2 sample sheet for use with bcl2fastq2 v2.20 analysis software. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq 6000Dx Operating Software (NVOS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq 6000Dx sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the NovaSeq 6000Dx Integration Package v1.0 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000Dx v1.0 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation v2.2.0 and NovaSeq 6000Dx v1.0 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.2.0

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000Dx v1.0 workflow.

Run Library Prep Validation v2.2.0

1. In Lab View, locate the Library Prep Validation v2.2.0 protocol.
   Samples are queued for the Library Prep Validation v2.2.0 step.

2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left, and drag them to the container wells on the right.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left, and drag them to the container on the right to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity. Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeqDx.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeqDx from the adjacent drop-down list. Select Apply.

   If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

   a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
   b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
   c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.
   d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.
7. Select Next Steps.

Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.

8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000Dx v1.0 workflow, Define Run Format (NovaSeqDx v1.0). This is the only step in Protocol 1: Run Format (NovaSeqDx v1.0).

Protocol 1: Run Format (NovaSeqDx v1.0)

This protocol includes a single step, Define Run Format (NovaSeqDx v1.0). The step allows for the assignment of per sample values for the following fields:

- NovaSeqDx Run Mode
- Loading Workflow Type
- Normalized Molarity
- Flowcell Type
- Final Loading Concentration (pM)

At the end of the step, samples are routed to the NovaSeqDx Standard or NovaSeqDx Xp protocol. This routing is done according to the selected Loading Workflow Type. The selected NovaSeqDx Run Mode must be compatible with the Loading Workflow Type and Flowcell Type.

Step 1: Run Define Run Format (NovaSeqDx v1.0)

1. In Lab View, locate the Run Format (NovaSeqDx v1.0) protocol. The samples are queued for the Define Run Format (NovaSeqDx v1.0) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - NovaSeqDx Run Mode—Select DX or RUO.
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.

- Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.

5. Select Next Steps, which triggers the Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Checks that the NovaSeqDx Run Mode value is compatible with the Loading Workflow Type and Flowcell Type. This automation also generates an error message if the Loading Workflow Type or the Flowcell Type are incompatible.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is recorded in the Warning field for the sample.
     To proceed, choose one of the following options:
     - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
     - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step. This step is the first step in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step. This step is the first step in the NovaSeq Xp protocol.

For Research Use Only. Not for use in diagnostic procedures.

Protocol 2: NovaSeqDx Standard (NovaSeqDx v1.0)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq 6000Dx run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0)
2. Dilute and Denature (NovaSeqDx v1.0)

Step 1: Run Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0)

1. In Lab View, locate the NovaSeqDx XP (NovaSeqDx v1.0) protocol.
   Samples for the Make Bulk Pool for NovaSeqDx Standard (NovaSeqDx v1.0) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
   When the step begins, the Validate Single NovaSeqDx Run Mode automation is triggered. This automation checks that the samples have the same NovaSeqDx Run Mode (RUO or DX).
4. On the Pooling screen, perform the following actions:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (eg, Pool #1).
   c. Select Record Details.
      After exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

- If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
- Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.
   - Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, it calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples that it contains. Select the file to download it and then open it in Excel.
8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeqDx v1.0).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeqDx v1.0).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeqDx v1.0) step.

Step 2: Run Dilute and Denature (NovaSeqDx v1.0)

1. In Lab View, locate the NovaSeqDx Standard (NovaSeqDx v1.0) protocol. The pool of samples queued for the Dilute and Denature (NovaSeqDx v1.0) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.

3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.

   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask that corresponds with the NovaSeqDx Run Mode in the following table. If the barcode does not match, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.

NovaSeqDx Run Mode	Valid Barcode Mask
RUO	[A-Z]{2}[0-9]{7}-[A-Z]{3}
DX	[A-Z]{2}[0-9]{7}-[A-Z]{5}

5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select the NaOH reagent kit and select New Lot.
   d. Enter the lot details.
   e. Set the Status of Reagent Lot toggle switch to Active.
   f. Select Save.
   g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
   h. Return to your original working browser tab and refresh the page.
6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 98 Fields Displayed on Record Details Screen of Denature and Dilute (NovaSeqDx v1.0)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
BaseSpace Sequence Hub Configuration	Select from the following preset options: • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Automatically populated with the preset GenerateFASTQ.
Workflow Type	Select from the following preset options: • No Index • Single Index • Dual Index • Custom
Index Read 1	Select from the following preset options: • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Select from the following preset options: • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Select from the following preset options: • True • False
Read 1 Cycles	Select from the following preset options: • 251 • 151 • 101 • 51 • type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

Field	Value
Read 2 Cycles	Select from the following preset options: • 251 • 151 • 101 • 51 • type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

7. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

   - Select Next Steps.
8. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

> Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

9. Select Finish Step.
   After exiting the step, the following actions occur:
   - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0).
   - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.

   At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0).

   > Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step. The integration adds samples automatically.

Protocol 3: NovaSeqDx Xp (NovaSeqDx v1.0)

In this protocol, samples are pooled and added to lanes on the NovaSeq 6000Dx flow cell. The option selected in the Define Run Format (NovaSeqDx v1.0) step determines the flow cell type.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0)
2. Dilute, Denature & ExAmp (NovaSeqDx v1.0)
3. Load to Flowcell (NovaSeqDx v1.0)

Step 1: Run Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.0) protocol. The samples are queued for the Make Bulk Pool for NovaSeqDx Xp (NovaSeqDx v1.0) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, do as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      > Create only one pool.

   b. Enter a name for the pool or accept the default name (eg, Pool #1).
   c. Select Record Details.
5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.

For Research Use Only. Not for use in diagnostic procedures.

- Only one pool was created.

6. On the Record Details screen, in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

7. [Optional] In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value if % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, the automation calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:
   - Copies the Flowcell Type values from the step inputs to the step outputs.
   - Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol—Dilute, Denature & ExAmp (NovaSeqDx v1.0).

   On the Assign Next Steps screen, the next step for samples is set to Dilute, Denature & ExAmp (NovaSeqDx v1.0).

For Research Use Only. Not for use in diagnostic procedures.

10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeqDx v1.0) step.

Step 2: Run Dilute, Denature & ExAmp (NovaSeqDx v1.0)

1. In Lab View, locate the NovaSeqDx Xp (NovaSeqDx v1.0) protocol. The pool of samples queued for the Dilute, Denature & ExAmp (NovaSeqDx v1.0) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (refer to the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots, do as follows.
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Select Save.
   f. Repeat this process to add and activate the remaining reagent lots.
   g. Return to your original working browser tab and refresh the page.

6. Add and activate reagent lots as follows.
   On the Record Details screen, the Reagent Lot Tracking section tracks the reagents used in the step.
   a. In a new browser tab, open another instance of Clarity LIMS.
   b. Navigate to the Consumables screen.
   c. Select one of the following reagent kits:
      - DPX1
      - DPX2
      - DPX3
      - NaOH
      - Resuspension buffer
      - Tris-HCl
   d. Select New Lot.
   e. Enter the lot details.
   f. Set the Status of Reagent Lot toggle switch to Active.
   g. Select Save.
   h. Repeat steps c–g for the remaining reagent lots.
   i. Return to the original instance of Clarity LIMS and refresh.
7. On the Record Details screen, perform the following actions:
   a. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   b. In the Step Details section, verify that the DPX1, DPX2, and DPX3 reagent volume values are populated. The script sets these values and they cannot be edited.
   c. [Optional] In the Sample Details table, select the pool icon to view details of the working pool composition.
   d. Make sure that the following values and columns are populated:
      - BP Aliquot
      - Mastermix per lane
      - NaOH
      - Tris-HCl
      - Flowcell Type
      - Loading Workflow Type

      A script sets these values and columns and they cannot be edited. The working pool number is appended to the bulk pool name, so that you can identify which working pools are derived from the same bulk pool.

For Research Use Only. Not for use in diagnostic procedures.

8. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
9. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeqDx v1.0).
10. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeqDx v1.0)

1. On the Ice Bucket screen, perform the following actions:
   a. In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   b. Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following information:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen, do as follows.
   a. Drag pools from the left of the screen over into the Placed Samples area on the right.
   b. Scan or type the barcode of the flow cell into the Flowcell field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type. This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs. The following table shows the barcode mask information.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DRX[XY2357]
S1	[A-Z0-9]{5}DRX[XY2357]
S2	[A-Z0-9]{5}DMX[XY2357]
S4	[A-Z0-9]{5}DSX[XY2357]

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. Refer to the following table for details.

For Research Use Only. Not for use in diagnostic procedures.

Table 99 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeqDx v1.0) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 1 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

Field	Value
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • Type a value between 0 and 251 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
Output Folder	Enter network path for sequencing run folder. For example: `\\networkshare\run_data`
Library Tube Barcode	Scan the library tube barcode.
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet, and then select Next Steps to trigger the automation script. The script performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

   The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.

6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.

For Research Use Only. Not for use in diagnostic procedures.

At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.

Proceed to AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0)

This protocol contains a single fully automated step - AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but you can review the stages of the step in Clarity LIMS (refer to Review Run Data).

Automations

The NovaSeqDx Run (NovaSeqDx v1.0) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) Package include a Set Next Steps automation configured on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step. You can use this automation to override the default next step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.0 Configuration and User Interaction* on page 185.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen. To make sure that the Lane Number displays correctly, do not disable or modify this automation.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics displayed on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle

- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global custom fields listed. Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2

- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000Dx Integration v1.0 Configuration and User Interaction* on page 185.

1. When setting up a run on the NovaSeq 6000Dx instrument, NVOS sends a request for the run recipe.
   a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step.
   b. Clarity LIMS sends a JSON response to NVOS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).
2. When the run starts, NVOS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates the kit and enables on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVOS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.

4. After primary analysis completes, NVOS sends a request containing the parsed run metrics. NVOS sends a request only when the run completes successfully. However, the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following:
   a. Records the metrics into the fields on file placeholder outputs in Clarity LIMS.
   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For more information, refer to *NovaSeq 6000Dx Integration v1.0 Configuration and User Interaction* on page 185.

   > *NovaSeq 6000Dx Integration v1.0 Configuration and User Interaction* on page 185 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq 6000Dx run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Worker*
- *Troubleshooting Automation* in the API

If an error occurs that does not provide direction on how to proceed, do as follows.

1. Confirm the version of the installed Illumina NovaSeq 6000Dx Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step, review the log file information. For more details, refer to the *Logging* on page 264 section.

If the automated run step starts, but does not complete, do as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS. You can use the Library Tube or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeqDx Standard or NovaSeqDx Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information.

If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging on page 264*.

3. Contact the Clarity LIMS support team. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.0) step, the Sequencer API writes a detailed log file to `/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`.

Log messages include the Library Tube ID and Flow Cell ID whenever the messages are related to a sequencing run-related request. In the Clarity LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most the log messages for this request. However, if all messages for downloading a file are found, then the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (which can also be found in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2021-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell

```

NovaSeq 6000Dx Integration v1.0 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeq 6000Dx Integration Package version 1.0.

Compatibility

This version of the integration package is compatible with the following software:

- BaseSpace Clarity LIMS v5.1 and later
- NGS Extensions Package v5.22 and later

- Illumina Preset Protocols (IPP) v2.4.0 and later
- NovaSeq 6000Dx Operating Software (NVOS) v2.3.1

New Features

Features provided with this release of the integration package are as follows.

- An API-based integration between the NovaSeq 6000Dx instrument and BaseSpace Clarity LIMS.
- A direct file and information exchange between Clarity LIMS and NVOS, which includes the following information:
  - Sample sheet generated on Clarity LIMS to NVOS
  - Run setup recipe generated on Clarity LIMS to NVOS
  - Run status updates (RunStarted, RunCompletedSuccessfully, RunEndedByUser, RunErroredOut) from NVOS to Clarity LIMS
  - Run metrics information from NVOS and Clarity LIMS
- Support for both RUO and DX modes.
- The NovaSeqDx v1.0 workflow, delivered directly from IPP v2.4.

Defects Fixed

None

Known Issues

None

Documentation

For detailed information related to this release, refer to the following documents:

- *NovaSeq 6000Dx Integration v1.0 Configuration & User Interaction*
- *NovaSeq 6000Dx Integration v1.0 Validation & Troubleshooting*

NovaSeq 6000 Integrations v3

The Illumina NovaSeq 6000 instrument integration provides preconfigured workflows that map to established lab protocols and steps used with NovaSeq instruments. The integration also supports the associated library prep kits, reagent kits, and assays used in these protocols.

The documents in this section support Illumina NovaSeq 6000 Integration version 3.x.

NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.6.0 supports the integration of Clarity LIMS to NovaSeq 6000 instruments. This documentation describes the integration and includes the following information:

- Preconfigured workflows, protocols, steps, and automations
- Installed components
- Configuration requirements, rules, and constraints

For instructions on validating and troubleshooting the NovaSeq 6000 Integration, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

> The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows - including renaming protocols, steps, and fields - could break process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq 6000 v3.8 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.8)
  - NovaSeq Standard (NovaSeq 6000 v3.8) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.8) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)
- Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file is automatically uploaded to the instrument through the API.

- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.1 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.8 workflow. For more information, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331. The Library Prep Validation v2.3.1 workflow is available in IPP v2.6 package.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.8 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.6.0 includes the following workflows:

- NovaSeq 6000 v3.8
- Library Prep Validation v2.3.1 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 100 NovaSeq 6000 Integration Package v3.6.0 Protocols and Steps

Protocol Name	Protocol Purpose	Steps Included in Protocol
	Library Prep Validation v2.3.1 Workflow	
Library Prep Validation v2.3.1	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.8) protocol. The protocol contains a single step - Library Prep Validation v2.3.1. After this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.8 workflow - Define Run Format (NovaSeq 6000 v3.8).	1. Library Prep Validation v2.3.1
	NovaSeq 6000 v3.8 Workflow	
Run Format (NovaSeq 6000 v3.8)	Allows for the assignment of per sample values for: • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.8)

For Research Use Only. Not for use in diagnostic procedures.

Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq Standard (NovaSeq 6000 v3.8)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) 2. Dilute and Denature (NovaSeq 6000 v3.8)
NovaSeq Xp (NovaSeq 6000 v3.8)	Samples are pooled and added to lanes on the NovaSeq flow cell. The option selected in the Define Run Format (NovaSeq 6000 v3.8) step determines the flow cell type. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) 2. Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) 3. Load to Flowcell (NovaSeq 6000 v3.8)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)

Validation Workflow

The Library Prep Validation v2.3.1 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v3.8 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Importing either the Library Prep Validation v2.3.1 workflow or the NovaSeq 6000 v3.8 workflows provides a global field named Illumina Universal Sample Identifier. This is a text field that is reserved for CLPA support and is optional. A value is not required for this integration.

Table 101 NovaSeq 6000 v3.8 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.8)	1. Define Run Format (NovaSeq 6000 v3.8)	Registered Step Started[1] Routing Script & Register Step Completed[2] Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v3.8)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8)	Calculate Volumes Register Pools & Register Step Completed[1] Register Step Started[1] Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute and Denature (NovaSeq 6000 v3.8)	Routing Script & Register Step Completed[2] Validate Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input & Register Step Started[2]

Protocol	Step	Automation
3. NovaSeq Xp (NovaSeq 6000 v3.8)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8)	Calculate Volumes Register Pools & Register Step Completed[1] Register Step Started[1] Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute, Denature & ExAmp (NovaSeq 6000 v3.8)	Calculate Volumes Register Step Completed[1] Set Next Step Validate Inputs Flowcell Type & Register Step Started[2]
	3. Load to Flowcell (NovaSeq 6000 v3.8)	Register Step Completed[1] Validate Flowcell Barcode Validate Inputs and Selected Container & Register Step Started[2] Validate Run Setup and Generate Sample Sheet
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)	Register NovaSeq RunCompleted & Register Step Completed[1] Register Step Started & Register NovaSeq Run & Register NovaSeq Run Association & Register NovaSeq RunStarted[1] Update Lane Number Set Next Steps (Not used. By default, the Sequencer API determines this functionality. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

[1] These automations are for CLPA support only.

[2] These automations are required for the NovaSeq 6000 v3.8 workflow to function properly. These automations contain additional logic needed for CLPA support. If you would like to remove CLPA support, then contact Illumina Support.
Automations not identified with [1] or [2] are required for the NovaSeq 6000 v3.8 to work function properly.

Protocol 1: Run Format (NovaSeq 6000 v3.8)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.8) or the NovaSeq Xp (NovaSeq 6000 v3.8) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.8).

Step 1. Define Run Format (NovaSeq 6000 v3.8)

Step input: NTP (normalized libraries)

Step output: None

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step by publishing messages to Clarity LIMS Product Analytics (CLPA) through the ICA LINK service:

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for CLPA support.

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration (pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
```

For Research Use Only. Not for use in diagnostic procedures.

```
}
```

- Compares each sample Normalized Molarity value with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, it sets the samples Loading Workflow Type to [Remove from workflow]. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
  input.::Warning:: = ::The Normalized Molarity is too low.:: ;
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; }
else { input.::Warning:: = ::not applicable:: }
```

At this point there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script & Register Step Completed Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.8 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.8 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) step.
- This automation also registers the completion time of the step by publishing messages to CLPA through the ICA LINK service. This is only used for CLPA support.
  Default automation command line is as follows:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l
{compoundOutputFileLuid0} script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.8' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
```

For Research Use Only. Not for use in diagnostic procedures.

```
--FIELD_VALUE 'NovaSeq Xp' \
--WORKFLOW 'NovaSeq 6000 v3.8' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"
```

Master Step Fields

The following table lists field configuration details defined on the Define Run Format (NovaSeq 6000 v3.8) master step.

Table 102 Define Run Format (NovaSeq 6000 v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text		None
Flowcell Type	Text Dropdown	Required Field Custom Entries	Presets • SP • S1 • S2 • S4
Instruction	Text	Read Only	Default • Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.8) step.

Table 103 Define Run Format (NovaSeq 6000 v3.8) Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed = 0 Presets • 225 • 400
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Warning	Text Dropdown	Read Only Custom Entries	The Normalized Molarity (nM) is too low. n/a

User Interaction

Refer to the Step 1: Define Run Format (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.8)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.8)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step by publishing messages to CLPA through the ICA LINK service:

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for CLPA support.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
```

```
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when selecting the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

For accurate pipetting of each sample in a pool, the Per Sample Volume (µl) value must be greater than or equal to the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, the automation calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0}
else {output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value and calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) { output.::Volume of Pool to Denature
(ul):: = 150 ; output.::NaOH Volume (ul):: = 37 ; output.::Tris-HCl Volume
(ul):: = 38 } ;
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(ul):: = 310 ; output.::NaOH Volume (ul):: = 77 ; output.::Tris-HCl Volume
(ul):: = 78 }
```

For Research Use Only. Not for use in diagnostic procedures.

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of Dilute and Denature (NovaSeq 6000 v3.8).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
-o 1.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
-o 2.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
-o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE. The samples advance to the Dilute and Denature (NovaSeq 6000 v3.8) step:

```
nextStep = ::ADVANCE::
```

Register Pools & Register Step Completed Automation

Automatically triggered on exit of the step, the following automation completes the following actions:

- Registers the pool and library information used by the Clarity LIMS workflow. Samples in the pool are assumed to have gone through library preparation.
- Registers the completion time of the step.

For Research Use Only. Not for use in diagnostic procedures.

These actions are done by publishing messages to CLPA through the ICA LINK service. This automation is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table lists configuration details defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step.

Table 104 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0

Field Name	Field Type	Options	Additional Options and Dropdown Items
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step.

Table 105 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	Read Only	Decimal places displayed = 0

User Interaction

Refer to the Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Step 2: Dilute and Denature (NovaSeq 6000 v3.8)

In this step, the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB) denatures and dilutes the pooled samples. Manually place the pooled samples into the library tube for the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input & Register Step Started Automation

Automatically triggered at the beginning of the step, this automation completes the following actions:

- Checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

- Registers the start time of the step by publishing messages to CLPA through the ICA LINK service. This script is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_
started.groovy'
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}:

```
if (!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::)) {
fail(::Invalid Library Tube Barcode. Verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit.

- If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.
- The script definition portion of the Generate Sample Sheet remains untouched.

Triggered by a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 317.
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
```

```
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is zero, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowc ell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validates UMI Settings.
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to contain only Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet when UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to REMOVE.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation*. Sample sheet template used depends on the selected value of Samplesheet Format and/or Reverse Complement Workflow.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
```

```
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script & Register Step Completed Automation

Automatically triggered on exit of the step, this automation completes the following actions:

- Invokes the changeWorkflow script. This script routes step outputs to the NovaSeq 6000 v3.8 workflow and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

```
script:changeWorkflow \
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.8' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS' \
```

- Registers the completion time of the step by publishing messages to CLPA through the ICA LINK service. This script is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_
completed.groovy'
```

Master Step Fields

The following table lists field configuration details defined on the Dilute and Denature (NovaSeq 6000 v3.8) step. These fields are required for sample sheet and JSON file generation.

Table 106 Dilute and Denature (NovaSeq 6000 v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Custom Recipe Path	Text		Not applicable
Experiment Name	Text	Required Field	Not applicable
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Output Folder	Text	Required Field	Not applicable
Override Cycles	Text		Not applicable
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (Not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Settings Header (not displayed in user interface)	Text	Read Only	Not applicable
UMI—Read 1 Length	Numeric		Range = 1
UMI—Read 1 Start From Cycle	Numeric		Range = 1
UMI—Read 2 Length	Numeric		Range = 1
UMI—Read 2 Start From Cycle	Numeric		Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail
(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
```

```
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) }; if (step.hasValue(::UMI - Read 2 Length::) ||

::REMOVE::
```

For Research Use Only. Not for use in diagnostic procedures.

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.8) step.

Table 107 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to the Step 2: Dilute and Denature (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.8)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.8) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8)
- Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v3.8)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.8)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

For Research Use Only. Not for use in diagnostic procedures.

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Register Step Started Automation

Automatically triggered on entry to the step, this automation registers the start time of the step by publishing messages to CLPA through the ICA LINK service:

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for CLPA support.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22;
step.::PhiX Volume (ul):: *= 0.8;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30;
step.::PhiX Volume (ul):: *= 1.1;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool, the Per Sample Volume (µl) value must be greater than or equal to the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step.

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Register Pools & Register Step Completed Automation

Automatically triggered on exit of the step, the following automation completes the following actions:

- Registers the pool and library information used by the Clarity LIMS workflow. Samples in the pool are assumed to have gone through library preparation.
- Registers the completion time of the step.

These actions are done by publishing messages to CLPA through the ICA LINK service. This automation is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_completed.groovy'
```

Master Step Fields

The following table lists field configuration details defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) step.

Table 108 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric		Range = 0–100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) step.

Table 109 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to the Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v3.8)

In this step, the addition of DPX, NaOH, Tris-HCl, and RSB denatures and dilutes the pooled samples. Manually create working pools based on the number of lanes that you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

Validate Inputs Flowcell Type & Register Step Started Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4). The automation also validates that all inputs have the same value for this field.
- Checks that the container type selected matches the value in the Flowcell Type field.

```
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}" \
```

- Registers the start time of the step by publishing messages to CLPA through the ICA LINK service:

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

  This automation is used only for CLPA support.

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)

- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (ul):: = 18 ;
output.::NaOH Volume (ul):: = 4;
output.::Tris-HCl Volume (ul):: = 5;
step.::DPX1 Volume (ul):: = 126 ;
step.::DPX2 Volume (ul):: = 18 ;
step.::DPX3 Volume (ul):: = 66 ;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (ul):: = 18;
output.::NaOH Volume (ul):: = 4;
output.::Tris-HCl Volume (ul):: = 5;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (ul):: = 22;
output.::NaOH Volume (ul):: = 5;
output.::Tris-HCl Volume (ul):: = 6;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (ul):: = 30;
output.::NaOH Volume (ul):: = 7;
output.::Tris-HCl Volume (ul):: = 8;
step.::DPX1 Volume (ul):: = 315;
step.::DPX2 Volume (ul):: = 45;
step.::DPX3 Volume (ul):: = 165;
output.::Mastermix per Lane (ul):: = 105
};
```

For Research Use Only. Not for use in diagnostic procedures.

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. This file contains information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the Load to Flowcell (NovaSeq 6000 v3.8) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
-o {compoundOutputFileLuid0}.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
-o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Register Step Completed Automation

Automatically triggered on exit of the step, this automation registers the completion time of the step by publishing messages to CLPA through the ICA LINK service. This script is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_
completed.groovy'
```

Master Step Fields

The following table lists field configuration details defined on the Load to Flowcell (NovaSeq 6000 v3.8) step. A script sets these field values. The values are not editable while running the step.

Table 110 Dilute, Denature & ExAmp (NovaSeq v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step.

Table 111 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

Refer to the Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Step 3: Load to Flowcell (NovaSeq 6000 v3.8)

In this step, scan the flow cell barcode into the Clarity LIMS. Then, manually place the working pools into the lanes of the flow cell for the NovaSeq run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container & Register Step Started Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` and `validateSelectedContainer` scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSelectedContainer true \
```

- Registers the start time of the step by publishing messages to CLPA through the ICA LINK service:

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy'
```

This automation is used only for CLPA support.

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-Z0-9]{5}DM[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Z0-9]{5}DS[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 317.
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters
are: a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if
Single Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
```

```
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error displays.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End
is True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be
defined if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.

  If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, the automation generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validates UMI Settings:
  - If UMI - Read 1 Length has value, UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, UMI - Read 2 Length must not have value.

For Research Use Only. Not for use in diagnostic procedures.

  - If UMI - Read 1 Start From Cycle has no value, UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::)
};
```

- Validates Analysis Software Version to make sure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed characters are 0-9 and period. It shall start and end with numbers and separated by single period e.g. 3.8.4::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

- Checks Override Cycles field value. This value can contain only Y, N, I, U, 0–9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet when UMI - Read 1 Length or UMI - Read 2 Length have values.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to ADVANCE, which advances to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. The sample sheet template depends on the selected value for Samplesheet Format and/or Reverse Complete Workflow. For more information, refer to *Sample Sheet Generation* on page 317.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p

```

Register Step Completed Automation

Registers the completion time of the step by publishing messages to CLPA through the ICA LINK service. This script is used only for CLPA support.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_
completed.groovy'
```

Master Step Fields

The following table lists the field configuration details defined on the Load to Flowcell (NovaSeq 6000 v3.8) step.

Table 112 Load to Flowcell (NovaSeq 6000 v3.8) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		Not applicable
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		Not applicable
Experiment Name	Text	Required Field	Not applicable
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Library Tube Barcode	Text	Required Field	Not applicable

Field Name	Field Type	Options	Additional Options and Dropdown Items
Output Folder	Text	Required Field	Not applicable
Override Cycles	Text		Not applicable
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Settings Header (not displayed in user interface)	Text	Read Only	Not applicable
UMI - Read 1 Length	Numeric		Range = 1
UMI - Read 1 Start From Cycle	Numeric		Range = 1
UMI - Read 2 Length	Numeric		Range = 1
UMI - Read 2 Start From Cycle	Numeric		Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value provided in the *Validation Script* on page 311 section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```

::ADVANCE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.8) step.

Table 113 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Analyte in Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

For Research Use Only. Not for use in diagnostic procedures.

User Interaction

Refer to the Step 3: Load to Flowcell (NovaSeq 6000 v3.8) section in *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)

This final protocol contains one fully automated step, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8), described in the following section.

> This step is fully automated. Do not add samples to the Ice Bucket or start the step manually. The sequencing service does not update samples correctly when they have been manually started.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

Register Step Started & Register NovaSeq Run & Register NovaSeq Run Association & Register NovaSeq Run Started Automation

Automatically triggered at the beginning of the step, this automation completes the following actions:

- Registers the start time of the step
- Registers the NovaSeq 6000 sequencing run configuration
- Registers the association of the sequencing run with the actual samples by linking the Instrument Run ID with samples ID
- Registers the time that the sequencing run started

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-
product-analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_
started.groovy' && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s
'com/illumina/upa/scripts/novaseq6000/register_novaseq_run.groovy' &&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-
analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/novaseq_
```

```
associate_seqrun.groovy' && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s
'com/illumina/upa/scripts/novaseq6000/novaseq_seqrun_started.groovy'"
```

These actions are done by publishing messages to CLPA through the ICA LINK service. This automation is used only for CLPA support.

Set Next Steps Automation

By default, the Set Next Steps automation is disabled (set to Not Used) and the Sequencer API sets the next step for samples.

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configuring autoComplete Properties* on page 329.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Register NovaSeq RunCompleted & Register Step Completed

Automatically triggered upon exiting the step, this automation registers the sequencing run completion time, run status, and run metrics.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-
product-analytics/automation/unified-product-analytics-automation.jar
script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/novaseq_
seqrun_completed.groovy' && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/unified-product-analytics/automation/unified-
product-analytics-automation.jar script:executeUPAAutomationScript -i
{stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s
'com/illumina/upa/scripts/common/step_completed.groovy'"
```

These actions are done by publishing messages to CLPA through the ICA LINK service. This automation is used only for CLPA support.

Master Step Fields

The following fields are configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step in Clarity LIMS:

- Current Cycle
- Current Read
- Firmware Version
- Flow Cell Expiration Date
- Flow Cell ID
- Flow Cell Lot Number
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Side
- Instrument Control Software Version
- Instrument ID
- Instrument Type
- Lane Counter
- Loading Workflow Type
- Output Folder
- RTA Version
- Run Completion Date
- Run ID
- Run Status
- Sequencing Log

Global Fields

The following fields are used to capture the run metrics in Clarity LIMS:

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2

- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeq Integration v3.8 configuration provided in the Illumina Preset Protocols (IPP) v2.6 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable through the Custom Fields screen in the Global Fields tab.
- If field names are changed in Clarity LIMS, they must also be changed through the `run.metricUdfNames` properties file in the `application.yml` file for the Sequencer API. For more information, refer to the *application.yml Properties* section in *Components Installed* on page 322. All fields are configured to be visible in the Sample Details table on the Record Details screen for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

These global custom fields are configured on the Container entity, visible on each input, but they should not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq Control Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run. This step is Dilute and Denature (NovaSeq 6000 v3.8) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.8) in the NovaSeq Xp protocol. This step places samples on the library tube or flow cell that are loaded in the NovaSeq 6000 instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one CSV format sample sheet file. The bcl2fastq v2.20 downstream analysis uses this file.

The sample sheet is uploaded to the NVCS via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from the Clarity LIMS using OAuth (instead of Basic Authentication), which is required for the NovaSeq 6000 instrument.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The following master step fields control the sample sheet content. These fields display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow
- Reverse Complement Workflow
- Samplesheet Format

Depending on Samplesheet Format field value selection, a v1 or v2 sample sheet is generated. For detailed information on the following items, refer to the *Bcl2fastq2 Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 and later)*:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000 Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000 instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at `/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen to the user. Log in to authorize the NVCS to use your account automatically to access Clarity LIMS.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact the Clarity LIMS at `http://localhost:9080/clarity/`. The installation script sets this URL, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 322.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
   - If authentication fails, the user is left on the login screen, and a warning message informs them of the failure. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000 of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The `sequencing-run/recipe/novaseq` endpoint consumes a POST request with a LibraryContainerId, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagent information is provided by the NovaSeq 6000.
   - LibraryContainerId and FlowCellId can match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

> Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 322.

3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API. Then, the run recipe is generated.
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.8) or Load to Flowcell (NovaSeq 6000 v3.8) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.8 workflow configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe. The value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 322. If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.
4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Content

The sample sheet content and the fields configured on the Dilute and Denature (NovaSeq 6000 v3.8) and Load to Flowcell (NovaSeq 6000 v3.8) steps control the content of the run recipe.

The following example shows the run recipe content:

```
{
"run_name": "NVCS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
```

For Research Use Only. Not for use in diagnostic procedures.

```
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found, or if the samples in the container are incorrectly queued, an error occurs and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged. The API cannot complete the step without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored. A warning is logged during lot tracking.
3. The type of flow cell being used in the run determines the number of replicates for the step.

- For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
- For XP mode, there is always one replicate, because there is already one input tracked for each lane.

4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged, and the reagent is ignored.
   - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and 2.
   - Name—Serial number in request
   - Lot Number—Lot number in request
   - Expiry—Expiry date in request
   - Status—Active

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.
6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 321.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 321.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Find the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, the Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If you end a sequencing run, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000 Integration v3.6.0 is distributed as the `BaseSpaceLIMS-sequencer-api` RPM package. This RPM package must be installed on the Clarity LIMS server.

The `BaseSpaceLIMS-sequencer-api` RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- Two configuration scripts: `configure_sequencer_api_proxy.sh` and `configure_sequencer_api_application.sh`

The NovaSeq 6000 v3 configuration is delivered through Illumina Preset Protocols (IPP) v2.6, which requires installation of the NGS Extensions Package v5.23.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.23.0 is installed, the latest version is installed by default with the NovaSeq 6000 integration. For more information, refer to *NovaSeq 6000 Integration v3.6 Release Notes* on page 368.
- If NGS Extensions Package v5.23.0 or later is already installed, the upgrade is not forced or required.

NovaSeq 6000 Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for Sequencer API application.
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMS Tomcat configuration to include Secret Util settings.
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with the Clarity LIMS.

application.yml Properties

The `application.yml` file is at `opt/gls/clarity/extensions/sequencer-api/`.

- All properties are configured automatically during installation, but they can also be configured by editing the `application.yml` file and then restarting Tomcat.
- Properties in the file represent all custom field names, both for recipe and run information.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 114 application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default (do not change) • tomcat
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (`configure_sequencer_api_application`) prompts for this URL.
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that is used when signing/validating OAuth tokens. Changing this key invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default • 88

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration can find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line must be indented to the same point and start with a dash (-). Default - "AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)" - "AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)"

novaseq.flowcells	List of supported NovaSeq flow cell types.
	• Type names exactly match the values used by the NVCS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4"`
	`lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	• **- lotName**—The name of the lot as it appears in the run started request.
	• - kitName—The name of the corresponding reagent kit in Clarity LIMS that the lot is tracked as.
	• The name can differ in the NVCS request versus the Clarity LIMS configuration.
	Default
	`- lotName: "Buffer"`
	`kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to the *Run Recipe Contents* section of *NovaSeq 6000 Run* on page 317. • Each value must be enclosed in quotes (eg, recipe.udfNames.runMode "Run Mode"). • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, recipe.udfNames.sampleLoadingType "Loading Workflow Type").
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

Property	Description
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)* on page 313. • Each value must be enclosed in quotes (eg, run.stepUdfNames.runID "Run ID") • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, run.stepUdfNames.sampleLoadingType "Loading Workflow Type"). It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file custom fields/measurement global field names to be used when recording run results. These fields capture the run data. For more information, refer to the *Global Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)* on page 313.
run.autoComplete	Determines whether the sequencing run step must be completed automatically after parsing the run metrics on a run along with run.autoCompleteOnlyAtSuccess. For more information, refer to *Configuring autoComplete Properties* on page 329. Default • true

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.autoCompleteOnlyAtSuccess	Determines which of the following options that the sequencing run step must be: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). For more information, refer to *Configuring autoComplete Properties* on page 329. Default • true

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the format [A-Z]{2}[0-9]{7}-[A-Z]{3} (eg, AB1234567-XYZ)
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DR[A-Z0-9]{2}
  - S2 flow cell: [A-Z0-9]{5}DM[A-Z0-9]{2}
  - S4 flow cell: [A-Z0-9]{5}DS[A-Z0-9]{2}
  - Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

1. On the steps that use the routing script (Define Run Format (NovaSeq 6000 v3.8) and Dilute and Denature (NovaSeq 6000 v3.8)), the Next Step for all samples must be set to Remove from workflow. A script sets this value. The value must not change in the Assign Next Steps screen.
2. In the Next Steps section of the protocol configuration screen, the method of assigning the next step must be set to Automation for the last step of the protocol.

Configuring autoComplete Properties

The `application.yml` configuration file contains the following properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow (AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)) is automatically completed when the run status is "RunCompletedSuccessfully" (default behavior) or regardless of the run status.

By default, both properties are set to true and the step only completes when the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

For the step to autoComplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.
3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 115 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete Property Value	run.autoCompleteOnlyAtSuccess Property Value	Outcome
true	true	• Step automatically completes only if sequencing run is successful. • If run is not successful, step does not automatically complete, and the run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There must not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)*.

For Research Use Only. Not for use in diagnostic procedures.

- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step. This step is a fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, Validate Run Setup and Generate Sample Sheet must be selected.

NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.6.0.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.8 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.8) step to the NovaSeq Standard (NovaSeq 6000 v3.8) or NovaSeq Xp (NovaSeq 6000 v3.8) step.
  - Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the Illumina NovaSeq 6000 Integration Package v3.6.0 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000 v3.8 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation and NovaSeq 6000 v3.8 workflows.
   - Library Prep Validation v2.3.1 is available with Illumina Preset Protocols (IPP) v2.6.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.3.1

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.8 workflow.

Run Library Prep Validation v2.3.1

1. In Lab View, locate the Library Prep Validation v2.3.1 protocol.
   Samples are queued for the Library Prep Validation v2.3.1 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, and drag them to the container wells on the right side.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

   If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

   a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
   b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.

For Research Use Only. Not for use in diagnostic procedures.

c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
   Triggers the Set Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.8 workflow, Define Run Format (NovaSeq 6000 v3.8). This step is the only one in Protocol 1: Run Format (NovaSeq 6000 v3.8).

Protocol 1: Run Format (NovaSeq 6000 v3.8)

This protocol includes a single step, Define Run Format (NovaSeq 6000 v3.8). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Define Run Format (NovaSeq 6000 v3.8)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.8) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.8) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.

- Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.

5. Select Next Steps, which triggers the Set Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (an empty value not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. Also, a message is recorded in the Warning field for the sample.
     At this point, there are two options:
     - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
     - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
7. Select Finish Step. The Routing Script & Register Step Completed automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step. This step is the first one in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) step. This step is the first one in the NovaSeq Xp protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.8)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run.

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.8) protocol. Samples for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
      After exiting from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the PhiX Volume (µl) value when % PhiX (2.5 nM) Spike-In has value.
- Calculates the Per Sample Volume (µl) value to be added to the pool.
- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, selects the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples that it contains. Select on the file to download it and then open it in Excel.

8. Select Next Steps to trigger the Set Next Steps automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.8).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.8).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.8) step.

Step 2: Dilute and Denature (NovaSeq 6000 v3.8)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.8) protocol. The pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.8) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input & Register Step Started automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}. If it does not, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.

To add and activate reagent lots:

a. In a new browser tab, open an additional instance of Clarity LIMS.
b. Navigate to the Consumables configuration screen.
c. Select the NaOH reagent kit and select New Lot.
d. Set the Status of Reagent Lot toggle switch to Active.
e. Enter the lot details.
f. Select Save.
g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
h. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 116 Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeq 6000 v3.8)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20

Field	Value
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.

Field	Value
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This selection triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

   - Select Next Steps.
9. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

10. Select Finish Step.
    After exiting the step, the following actions occur:
    - The Routing Script & Register Step Completed automation is triggered and samples are routed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

For Research Use Only. Not for use in diagnostic procedures.

At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step. The integration adds samples automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.8)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The option selected in the Define Run Format (NovaSeq 6000 v3.8) step determines the flow cell type.

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.8) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, create and name a pool as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      Create only one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

- If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
- Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

7. In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes. This selection triggers the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value when % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculate the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.
9. Select Next Steps to trigger the Set Next Steps automation. This automation performs the following actions:
   - Copies the Flowcell Type values from the step inputs to the step outputs.
   - Sets the next step for samples to ADVANCE, advancing them to the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step in the protocol.

   On the Assign Next Steps screen, the next step for samples is set to the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step in the workflow.
10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step.

Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v3.8)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.8) protocol. The pool of samples queued for the Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.

3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (see the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Select Save.
   f. Repeat this process to add and activate the remaining reagent lots.
   g. Return to your original working browser tab and refresh the page.
6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are prepopulated. The script sets the values and they are not editable.
   - In the Sample Details table, select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. The script sets the values and they are not editable.

- The Flowcell Type and Loading Workflow Type columns are populated.
- The working pool number is appended to the bulk pool name, to identify which working pools are derived from the same bulk pool.

7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.8).
9. Select Finish Step.

Step 3: Load to Flowcell (NovaSeq 6000 v3.8)

1. On the Ice Bucket screen:
   - In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   - Select Begin Work.
2. The Validate Inputs and Selected Container & Register Step Started automation checks the following:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag one or more pools from the left of the screen over into the Placed Samples area on the right.
   - Scan or type the barcode of the flow cell into the Flowcell field.
   - Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type (as listed in the following table). This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DR[A-Z0-9]{2}
S1	[A-Z0-9]{5}DR[A-Z0-9]{2}

Flowcell Type	Barcode Mask
S2	[A-Z0-9]{5}DM[A-Z0-9]{2}
S4	[A-Z0-9]{5}DS[A-Z0-9]{2}

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. For details, refer to the following table:

   Table 117 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.8) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Library Tube Barcode	Scan the library tube barcode.
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet to trigger the automation script, which does the following:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but the various stages can be reviewed in Clarity LIMS under Review Run Data.

Automations

The NovaSeq Run (NovaSeq 6000 v3.8) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) include a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step. You can use this automation to override the default next step behavior. For details, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266for details.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen.
  Do not disable or modify this automation to make sure that the Lane Number displays properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate in the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version

For Research Use Only. Not for use in diagnostic procedures.

- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global fields listed. Values are aggregated across all lanes. Some values (for example Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.

1. When setting up a run on the NovaSeq 6000 instrument, NVCS sends a request for the run recipe.
    a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step.

b. Clarity LIMS sends a JSON response to NVCS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).

2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates and enables it on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.
4. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends a request only when the run completed successfully, but the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following actions:
   a. Records the metrics into the fields on file placeholder outputs in the LIMS.
   b. Completes the step in Clarity LIMS when the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For details, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.

   > *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq 6000 run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Informatics*
- *Troubleshooting Automation in the API*

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq 6000 Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step, review the log file information. For details, refer to *Logging* on page 350.

If the automated run step starts but does not complete, proceed as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS, using either the Library Tube, or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If you are unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging* on page 350.
3. Contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8) step, the Sequencer API writes a detailed log file to the following location:

```
/opt/gls/clarity/tomcat/current/logs/sequencer-api.log
```

Log messages include the Library Tube ID and Flowcell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most the log

messages for this request. However, if all messages for downloading a file are found, the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (also included in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2021-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell
Id=RM123DSXX] LimsApiLookupUtil : Searching for containers with name 'NV1234567-
LIB' or 'RM123DSXX'
....
2021-06-19 21:35:27.158 INFO --- [] FileService : Successfully retrieved file
'NV1234567-LIB.csv' with LIMS ID 40-51 through the API.
```

NovaSeq 6000 Integration v3.6.0 Installation

The Illumina NovaSeq 6000 Integration v3.6.0 supports the integration between Clarity LIMS (v6.2 and later) and the NovaSeq 6000 instrument. This integration also includes updates to the technology stack and third party libraries and utilities. The key changes from v3.5.1 are as follows.

- Updated the preconfigured NovaSeq 6000 workflow to include Clarity LIMS Product Analytics (CLPA) automation scripts by default.
- Compatibility with Oracle Linux. For compatibility, refer to *NovaSeq 6000 Integration v3.6 Release Notes* on page 368.

Clarity LIMS is automatically stopped during installation of the RPM and will need to be restarted.

The file-based and API-based integrations cannot run at the same time. When the API-based integration has finished installing, shut down Clarity LIMS and uninstall the file-based integration.

This document provides instructions for installing NovaSeq 6000 Integration v3.6.0. It also describes the components that are installed in the default configuration.

- If you are installing the NovaSeq 6000 integration for the first time, follow the instructions provided in this document.
- If NovaSeq 6000 Integration v3.5.1 is already installed, with only minor changes to the default configuration, follow the instructions provided in this document and then duplicate the configuration changes from the v3.5.1 workflow.
- If there have been significant changes to the default configuration, follow the instructions provided in *NovaSeq 6000 Integration v3.6.0 Manual Upgrade* on page 360.

Integration Overview

Illumina NovaSeq 6000 Integration v3.6.0 includes the following features and functionality.

- Preconfigured NovaSeq 6000 v3.8 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.8)
  - NovaSeq Standard (NovaSeq 6000 v3.8) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.8) (supports individual lane loading on the NovaSeq 6000)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)
- Automated generation of the v1 or v2 sample sheet. This file is automatically uploaded to the sequencing instrument through the Sequencer API and is used to set up the run.
- Automated validation of run setup information. This information is uploaded to the NovaSeq Control Software (NVCS) through the Sequencer API. It is used to create the run recipe and initiate the run.
- Automated tracking of the following NovaSeq sequencing runs and parsing of run statistics into Clarity LIMS:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.1 workflow used for validation purposes. This workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.8 workflow. For more information, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

Supporting Documentation

- For details on installed protocols and steps, automations, generated and captured files, and rules and constraints, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.
- For information on validating and troubleshooting the integration, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.
- For information on the NovaSeq 6000 instrument system, refer to the *NovaSeq 6000 System Support Resources*.

Prerequisites

NovaSeq 6000 Integration v3.6.0 has the following prerequisites:

Prerequisite 1: Secret Utility Configuration

If Clarity LIMS Secret Utility is not installed or configured, use the following information to configure Secret Utility:

Installation on a hosted system with Clarity LIMS (v6.2 or later)

The Clarity LIMS installation tooling configures this installation. No additional configuration is necessary.

Installation on an on-premise Clarity LIMS instance (v6.2 or later)

The installation requires the following passwords:

- Tenant DB Password
- Clarity DB Password
- FTP password
- LDAP manager password (if LDAP is enabled)
- LabLink DB password
- Reporting DB password (if installed)
- RabbitMQ password

For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

Prerequisite 2: Illumina Preset Protocols (IPP) v2.6

The integration package depends on the configuration provided in Illumina Protocols (IPP) v2.6.

The installation procedure provided in this document includes steps that install the following IPP configurations on the server used for the NovaSeq 6000 integration installation:

- NovaSeq configuration
- Library Prep Validation configuration (optional, but recommended)

For details on IPP v2.6 installation and configuration, refer to the *Illumina Preset Protocols* documentation.

Prerequisite 3: Proxy Update (Illumina Cloud Hosted Installation Only)

The Illumina cloud hosted installation configures an additional include directive for `/etc/httpd/conf.d/clarity.conf` in the proxy configuration. Additional proxy configuration files for the Sequencer API service are expected to be placed in the `/etc/httpd/conf.d/clarity` folder.

Sequencer API RPM Installation Components

NovaSeq Integration v3.6.0 is distributed as the BaseSpaceLIMS-sequencer-api RPM package. This package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following files and scripts:

- Sequencer API WAR file
- `application.yml` configuration file
- `configure_sequencer_api_proxy.sh` configuration script
- `configure_sequencer_api_env.sh` configuration script
- `configure_sequencer_api_application.sh` configuration script

Sequencer API WAR

The RPM installs the Sequencer API WAR file into the same Tomcat container as Clarity LIMS. The WAR file is at `/opt/gls/clarity/tomcat/current/webapps/Illumina#Sequencer#v2##2.6.0.0.war`. The version number can differ.

The WAR file is deployed automatically when Clarity LIMS launches. Because the RPM installs a new WAR file, Clarity LIMS is automatically stopped during installation of the RPM. Restart Clarity LIMS before installing the NovaSeq and Library Prep Validation workflow configuration from the IPP.

Configuration File

The `application.yml` configuration file is installed at `/opt/gls/clarity/extensions/sequencer-api/application.yml`. As part of the installation process, the file is configured with one of the configuration scripts.

For a complete list of all properties included in the `application.yml` file, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266

Configuration Scripts

The scripts in the following table are installed at the `/opt/gls/clarity/config/` folder. During installation, the RPM runs these scripts as they are needed.

Script Name	User	Description
configure_sequencer_api_proxy.sh	root	Adds configuration to the proxy to allow communication with the Sequencer API after Tomcat has been started. Run this script in the following scenarios: • When the Sequencer API is first installed. • When reconfiguring the Clarity LIMS proxy. This process happens until a version of Clarity LIMS that includes the necessary configuration files from `/etc/httpd/clarity/*.conf` is available. Not required for Illumina cloud hosted installations.
configure_sequencer_api_env.sh	root	Adds Secret Management setting into the Clarity LIMS Tomcat configuration. Run this script when the Sequencer API is first installed on a Secret Util-enabled Clarity LIMS.

Script Name	User	Description
configure_sequencer_api_application.sh	glsjboss	• Configures the installed `application.yml` file. • Sets the Clarity LIMS URL and the key to use when signing access tokens. Run this script when the Sequencer API is first installed. If you run the script multiple times, the script reconfigures each setting to its default. The only exception is the signing key. For this setting, you are asked if you want a reset. If the reset is done, all previously issued tokens are no longer valid.

Installation Steps

If running the sequencing service and Automation Worker on the same instance, the instance must also be running a compatible version of Oracle Linux. For compatibility, refer to *NovaSeq 6000 Integration v3.6 Release Notes* on page 368.

Install the IPP Package

1. On the server being used to install the integration, log in as the root user.
2. Use the following yum command to install the IPP RPM:

```
yum install BaseSpaceLIMS-Illumina-Preset-Protocols --enablerepo=<< repo name info from support >>
```

   The `--enablerepo` command-line argument must be included to enable the repo. The Illumina Support team can provide you with the repo file with the appropriate naming convention.
3. Enter `y` to confirm that you want to proceed with the RPM and package installation.
4. Make sure that NGS Extension Package v5.23 is installed.
   If this package is not installed, install it or upgrade the existing package.

For information on IPP installer commands, parameters, and options, refer to the *Illumina Preset Protocols* documentation.

Install Sequencer API

Install the Sequencer API as follows.

1. On the Clarity LIMS server, log in as the root user.
2. Use the following yum command to install the RPM:

```
yum install BaseSpaceLIMS-sequencer-api --enablerepo=< repo name info from
support >
```

   The `--enablerepo` command-line argument must be included to enable the repo. The Illumina Support team can provide you with the repo file with the appropriate naming convention.

3. Enter `y` to confirm that you want to proceed with the RPM installation.
4. If necessary, install the Secret Utility Package.
   For more information on this package, refer to *Prerequisite 1: Secret Utility Configuration* on page 353.
5. As the glsjboss user, run configure_sequencer_api_application.sh from the following location:

```
bash /opt/gls/clarity/config/configure_sequencer_api_application.sh
```

6. Enter values for the following questions:
   You can also accept the default values in the `application.yml` configuration file by pressing Enter. For more information about the `application.yml` properties, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.
   - Would you like to use the apiuser user for communication with Clarity? [Y]
   - Enter required value for Token Expiry (hours) [88]
7. Update the Clarity LIMS proxy for the Sequencer API as follows.
   - For an on-premise system, run the following command:

```
bash /opt/gls/clarity/config/configure_sequencer_api_proxy.sh
```

   - For an Illumina cloud hosted system, make sure that the proxy has been updated as follows. Place the `sequencer-api.include` file in `/etc/httpd/conf.d/clarity`.

```
<Location "/Illumina/Sequencer/v2">
ProxyPass ajp://localhost:9009/Illumina/Sequencer/v2
ProxyPassReverse ajp://localhost:9009/Illumina/Sequencer/v2
</Location>
```

8. Update the Clarity LIMS Tomcat configuration as follows.
   a. Make sure that the Secret Util is installed and configured. For more information, refer to *Prerequisite 1: Secret Utility Configuration* on page 353.
   b. Run the following command to add the Secret Utility configuration to Clarity LIMS:

```
bash /opt/gls/clarity/config/configure_sequencer_api_env.sh
```

For Research Use Only. Not for use in diagnostic procedures.

> This script modifies `/opt/gls/clarity/tomcat/current/bin/setenv.sh` for Clarity LIMS Tomcat to load the Secret Utility environment variable file (`/etc/profile.d/claritysecret.sh`) during startup.

c. Use the following command to Start Clarity LIMS:

```
/opt/gls/clarity/bin/run_clarity.sh start
```

Install NovaSeq and Library Prep Validation Workflow Configuration

Install the NovaSeq and Library Prep workflow configuration from IPP as follows.

1. As the glsjboss user, run the following command to install the NovaSeq 6000 v3.8 workflow configuration:

```
bash /opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.novaseq-v3.8
```

> The installer validates the import of the workflow and provides the Warning/Error details in STDOUT, which allows you to either proceed with the import or cancel it.

2. [Optional] Run the following command to install the Library Prep Validation v2.3.1 workflow:

```
/opt/gls/clarity/config/illumina-preset-protocols-installer.sh -o install
Illumina_Instruments.LibraryPrepValidation-v2.3
```

This step is optional, but recommended. The Library Prep Validation v2.3.1 workflow allows you to validate the NovaSeq 6000 v3.8 workflow.

Check Sequencer API

Make sure that the Sequencer API is working as follows.

1. Visit `https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/sequencing-run/login`. This page returns the following URL string:

```
https://<< Clarity LIMS URL >>/Illumina/Sequencer/v2/oauth/authorize?client_
id=illumina_sequencer&amp;redirect_uri=../sequencer_login&amp;response_
type=token
```

2. Copy and paste the URL string into the browser. The Clarity LIMS Sign In page opens.
3. Enter sign in credentials.
4. Select Sign In. A Successfully Authenticated message displays.

[Optional] Configure application.yml Properties

The installer script configures the `application.yml` configuration properties by prompting for values. You can also configure these properties by editing the `application.yml` file, and then restarting Clarity LIMS. Configuring these properties is optional.

For more information, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.

Workflows, Protocols, and Steps Installed

NovaSeq 6000 Integration v3.6.0 includes the workflows, protocols, and steps listed in the following table.

Package	Workflow	Protocols	Steps
IPP v2.6	NovaSeq 6000 v3.8	Run Format (NovaSeq 6000 v3.8)	1. Define Run Format (NovaSeq 6000 v3.8)
		NovaSeq Standard (NovaSeq 6000 v3.8)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.8) 2. Dilute and Denature (NovaSeq 6000 v3.8)
		NovaSeq Xp (NovaSeq 6000 v3.8)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.8) 2. Dilute, Denature & ExAmp (NovaSeq 6000 v3.8) 3. Load to Flowcell (NovaSeq 6000 v3.8)
		AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.8)
	Library Prep Validation v2.3.1	Library Prep Validation v2.3.1	1. Library Prep Validation v2.3.1

For detailed descriptions of the steps and automations included in each protocol, and details on other components in the configuration, refer to *NovaSeq 6000 Integration v3.6.0 Configuration and User Interaction* on page 266.

For instructions on using the Library Prep Validation v2.3.1 protocol, refer to *NovaSeq 6000 Integration v3.6.0 Validation and Troubleshooting* on page 331.

The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows, including renaming protocols, steps, and fields, could break process.

Instrument Software

The NovaSeq instrument software includes the following components:

- NovaSeq Control Software (NVCS)—Contains the user interface for setting up the sequencing run. Responsible for controlling the instrument and acquiring the images.
- Real-Time Analysis v3 (RTA3)—Takes the images generated by the first module, processes, and analyzes them. Makes sure that data files are created and copied to the final destination folder.
- Sequencing Analysis Viewer (SAV)—Displays the important quality metrics generated by the RTA3 software.
- NovaSeq recipes—Provides system operation instructions for use with NovaSeq 6000 reagent kits for SP, S1, S2, and S4 flow cells.
- Universal Copy Service—Copies output files to destinations such as final destination folder and/or BaseSpace Sequence Hub (when the instrument is configured for use with BaseSpace Sequence Hub).

Instrument Integration Configuration

For the NovaSeq API integration to work, the NovaSeq instrument must be able to communicate with Clarity LIMS through the API. Complete the following steps to configure the NVCS and confirm that you can access Clarity LIMS from the instrument.

1. Launch NVCS and wait for the initialization process to complete.
2. On the NVCS Settings page, do the following:
   a. Under Mode Selection, select Server-Based.
   b. In the adjacent field, enter the Clarity LIMS URL (eg, `https://customerserver.claritylims.com`).
   c. [Optional] In the Output Folder field, enter the default output folder location. You can also specify the output folder location when setting up a run in NVCS.
3. Select Save to complete the configuration.
4. On the NVCS home page, you can now select Sequence to log into Clarity LIMS and start a run.

NovaSeq 6000 Integration v3.6.0 Manual Upgrade

NovaSeq Integration Package v3.6.0 contains modifications to the existing automations from NovaSeq Integration Package v3.5.1. The NovaSeq Sequencing v3.8 workflow and Illumina Preset Protocols (IPP) v2.6 are required for the integration package to work.

If you do not want to upgrade the existing NovaSeq Sequencing workflow to the latest version through IPP, you can update the workflow configuration manually by completing the following steps.

The key change between NovaSeq 6000 v3.7 workflow and NovaSeq 6000 v3.8 workflow that comes with NovaSeq 6000 Integration v3.6.0 is the addition of Clarity LIMS Product Analytics (CLPA) enabled automation scripts. If CLPA is not required, it is not necessary to perform this manual upgrade.

Add New Automations

1. From Configuration, select the Automation tab.
2. Add the automations in the following table:

Table 118 Automations

Automation Name	Command Line	Master Steps
Register NovaSeq RunCompleted & Register Step Completed	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/novaseq_seqrun_completed.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"`	AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

Automation Name	Command Line	Master Steps
Register Pools & Register Step Completed	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/pooling.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"`	Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)
Register Step Completed	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"`	Dilute, Denature & ExAmp (NovaSeq 6000 v3.7) Load to Flowcell (NovaSeq 6000 v3.7)
Register Step Started[1]	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'"`	Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)

Automation Name	Command Line	Master Steps
Register Step Started[2]	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy'"`	Define Run Format (NovaSeq 6000 v3.7)

For Research Use Only. Not for use in diagnostic procedures.

Automation Name	Command Line	Master Steps
Register Step Started & Register NovaSeq Run & Register NovaSeq Run Association & Register NovaSeq RunStarted	`bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_started.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/register_novaseq_run.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/novaseq_associate_seqrun.groovy' && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/novaseq6000/novaseq_seqrun_started.groovy'"`	AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

[1] This automation has -l {compoundOutputFileLuid0} in the log file output index.
[2] This automation has -l {compoundOutputFileLuid1} in the log file output index.

Modify Routing Script Automation on Define Run Format (NovaSeq 6000 v3.7) Step

1. From Configuration, select the Automation tab.

For Research Use Only. Not for use in diagnostic procedures.

2. Under the Step Automation tab, select the Routing Script automation that is enabled on the Define Run Format (NovaSeq 6000 v3.7) master step.
3. In the automation name field, change the name to Routing Script & Register Step Completed.
4. Update the existing command line as follows.
   Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0} script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"
```

5. Select Save.

Modify Routing Script Automation on Dilute and Denature (NovaSeq 6000 v3.7) Step

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Routing Script automation that is enabled on the Dilute and Denature (NovaSeq 6000 v3.7) master step.
3. In the automation name field, change the name to Routing Script & Register Step Completed.
4. Update the existing command line as follows.
   Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0} script:changeWorkflow \
\
```

```
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid0} -s 'com/illumina/upa/scripts/common/step_completed.groovy'"
```

5. Select Save.

Modify Validate Inputs and Selected Container Automation on Load to Flowcell (NovaSeq 6000 v3.7) Step

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Inputs and Selected Container automation that is enabled on the Load to Flowcell (NovaSeq 6000 v3.7) master step.
3. In the automation name field, change the name to Validate Inputs and Selected Container & Register Step Started.
4. Update the existing command line as follows.
   Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar script:validate_flowcell_for_input_pools -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -validateSelectedContainer true && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'"
```

5. Select Save.

For Research Use Only. Not for use in diagnostic procedures.

Modify Validate Inputs Flowcell Type Automation on Dilute, Denature & ExAmp (NovaSeq 6000 v3.7) Step

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Inputs Flowcell Type automation that is enabled on the Dilute, Denature & ExAmp (NovaSeq 6000 v3.7) master step.
3. In the automation name field, change the name to Validate Inputs Flowcell Type & Register Step Started.
4. Update the existing command line as follows.
   Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar script:validate_flowcell_for_input_pools -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'"
```

5. Select Save.

Modify Validate Single Input Automation on Dilute and Denature (NovaSeq 6000 v3.7) Step

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Single Input automation that is enabled on the Dilute and Denature (NovaSeq 6000 v3.7) master step.
3. In the automation name field, change the name to Validate Single Input & Register Step Started.
4. Update the existing command line as follows.
   Changes are highlighted in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} script:validateSampleCount -min 1 -max 1 && /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/unified-product-analytics/automation/unified-product-analytics-automation.jar script:executeUPAAutomationScript -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -s 'com/illumina/upa/scripts/common/step_started.groovy'"
```

5. Select Save.

Set Trigger Location and Style for New Automations

1. From Configuration, select the Lab Work tab.

For Research Use Only. Not for use in diagnostic procedures.

2. Change the trigger locations and styles for the automations in the following table:

Table 119 Automation Settings

Step Name	Automation Name	Trigger Location	Trigger Style
Define Run Format (NovaSeq 6000 v3.7)	Register Step Started	Step	Automatic upon entry
Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)	Register Step Started	Step	Automatic upon entry
	Register Pools & Register Step Completed	Step	Automatic upon exit
Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)	Register Step Started	Step	Automatic upon entry
	Register Pools & Register Step Completed	Step	Automatic upon exit
Dilute, Denature & ExAmp (NovaSeq 6000 v3.7)	Register Step Completed	Step	Automatic upon exit
Load to Flowcell (NovaSeq 6000 v3.7)	Register Step Completed	Step	Automatic upon exit
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)	Register Step Started & Register NovaSeq Run & Register NovaSeq Run Association & Register NovaSeq RunStarted	Step	Automatic upon entry
	Register NovaSeq RunCompleted & Register Step Completed	Step	Automatic upon exit

NovaSeq 6000 Integration v3.6 Release Notes

These release notes describe the key changes to software components for the Clarity LIMS NovaSeq 6000 Integration Package v3.6.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v6.2 and later
- NGS Extensions Package v5.23 and later
- Illumina Preset Protocols (IPP) v2.6.0 and later
- NovaSeq Control Software (NVCS) v1.8.0

For Research Use Only. Not for use in diagnostic procedures.

- Illumina bcl2fastq v2.20
- Oracle Linux (64-bit) v8.8

New Features

- Updates Groovy to v3.0.7.
- Replaces the non-CLPA enabled NovaSeq 6000 v3 workflow with the CLPA enabled workflow.

Defects Fixed

During configuration, you can now validate the existence of the input user instead of resetting the user and password.

Known Issues

None

NovaSeq 6000 Integration v3.5.1 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.5.1 supports the integration of Clarity LIMS to Illumina NovaSeq 6000 instruments. This documentation describes the integration and includes the following information:

- Preconfigured workflows, protocols, steps, and automations
- Installed components
- Configuration requirements, rules, and constraints

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, refer to *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

> The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows - including renaming protocols, steps, and fields - could break process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq 6000 v3.7 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.7)
  - NovaSeq Standard (NovaSeq 6000 v3.7) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.7) (supports individual lane loading on the NovaSeq)

  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)
- Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file is automatically uploaded to the instrument through the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v2.3.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.7 workflow. For more information, refer to *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429. The Library Prep Validation v2.3.0 workflow is available in IPP v2.5 Package.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.7 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.5.1 includes the following workflows:

- NovaSeq 6000 v3.7
- Library Prep Validation v2.3.0 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 120 NovaSeq 6000 Integration Package v3.5.1 Protocols and Steps

Protocol Name	Protocol Purpose	Steps Included in Protocol
	Library Prep Validation v2.3.0 Workflow	
Library Prep Validation v2.3.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.7) protocol. The protocol contains a single step - Library Prep Validation v2.3.0. After this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.7 workflow - Define Run Format (NovaSeq 6000 v3.7).	1. Library Prep Validation v2.3.0
	NovaSeq 6000 v3.7 Workflow	
Run Format (NovaSeq 6000 v3.7)	Allows for the assignment of per sample values for: • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.7)

Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq Standard (NovaSeq 6000 v3.7)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) 2. Dilute and Denature (NovaSeq 6000 v3.7)
NovaSeq Xp (NovaSeq 6000 v3.7)	Samples are pooled and added to lanes on the NovaSeq flow cell. The option selected in the Define Run Format (NovaSeq 6000 v3.7) step determines the flow cell type. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) 2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) 3. Load to Flowcell (NovaSeq 6000 v3.7)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

Validation Workflow

The Library Prep Validation v2.3.0 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v3.7 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Table 121 NovaSeq 6000 v3.7 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.7)	1. Define Run Format (NovaSeq 6000 v3.7)	Routing Script Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v3.7)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute and Denature (NovaSeq 6000 v3.7)	Routing Script Check Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.7)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. The core Clarity LIMS configuration for pooling handles this functionality.)
	2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.7)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)	Update Lane Number Set Next Steps (Not used. By default, the Sequencer API determines this functionality. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Terminology

This integration package supports BaseSpace Clarity LIMS v5.1 and later.

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.7)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.7) or the NovaSeq Xp (NovaSeq 6000 v3.7) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.7).

Step 1. Define Run Format (NovaSeq 6000 v3.7)

Step input: NTP (normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares each sample Normalized Molarity value with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, it sets the samples Loading Workflow Type to [Remove from workflow]. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
  input.::Warning:: = ::The Normalized Molarity is too low.:: ;
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; }
else { input.::Warning:: = ::not applicable:: }
```

At this point there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.7 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.7 workflow. Then, the samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step.

Default automation command line is as follows:

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
```

For Research Use Only. Not for use in diagnostic procedures.

```
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Master Step Fields

The following table lists field configuration details defined on the Define Run Format (NovaSeq 6000 v3.7) master step.

Table 122 Define Run Format (NovaSeq 6000 v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text		None
Flowcell Type	Text Dropdown	Required Field Custom Entries	Presets • SP • S1 • S2 • S4
Instruction	Text	Read Only	Default • Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.7) step.

Table 123 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed = 0 Presets • 225 • 400
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Warning	Text Dropdown	Read Only Custom Entries	The Normalized Molarity (nM) is too low. Not applicable

User Interaction

Refer to Run Define Run Format (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.7)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.7)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when selecting the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool, the Per Sample Volume (µl) value must be greater than or equal to the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, the automation calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0}
else {output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value and calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) { output.::Volume of Pool to Denature
(ul):: = 150 ; output.::NaOH Volume (ul):: = 37 ; output.::Tris-HCl Volume
(ul):: = 38 } ;
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(ul):: = 310 ; output.::NaOH Volume (ul):: = 77 ; output.::Tris-HCl Volume
(ul):: = 78 }
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of Dilute and Denature (NovaSeq 6000 v3.7).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
-o 1.csv \
script:driver_file_generator \
```

```
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
-o 2.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
-o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE. The samples advance to the Dilute and Denature (NovaSeq 6000 v3.7) step:

```
nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists configuration details defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step.

Table 124 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100 Decimal places displayed = 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step.

Table 125 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	Read Only	Decimal places displayed = 0

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Step 2: Dilute and Denature (NovaSeq 6000 v3.7)

In this step, the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB) denatures and dilutes the pooled samples. Manually place the pooled samples into the library tube for the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}:

```
if (!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::)) {
fail(::Invalid Library Tube Barcode. Verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit.

- If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.
- The script definition portion of the Generate Sample Sheet remains untouched.

Triggered by a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 416.
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
```

```
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is zero, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowc ell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
```

```
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validates UMI Settings.
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to contain only Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet when UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to REMOVE.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 582. Sample sheet template used depends on the selected value of Samplesheet Format and/or Reverse Complement Workflow.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
```

```
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script. This script routes step outputs to the NovaSeq 6000 v3.7 workflow and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

Default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2}
script:changeWorkflow \
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.7' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

The following table lists field configuration details defined on the Dilute and Denature (NovaSeq 6000 v3.7) step. These fields are required for sample sheet and JSON file generation.

Table 126 Dilute and Denature (NovaSeq 6000 v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		Not applicable

Field Name	Field Type	Options	Additional Options and Dropdown Items
Experiment Name	Text	Required Field	Not applicable
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Output Folder	Text	Required Field	Not applicable
Override Cycles	Text		
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (Not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Setting Header (not displayed in user interface)	Text	Read Only	Not applicable
UMI—Read 1 Length	Numeric		Range = 1
UMI—Read 1 Start From Cycle	Numeric		Range = 1
UMI—Read 2 Length	Numeric		Range = 1
UMI—Read 2 Start From Cycle	Numeric		Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||

step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep =
::REMOVE::
```

For Research Use Only. Not for use in diagnostic procedures.

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.7) step.

Table 127 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Dilute and Denature (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.7)

Samples are routed to this protocol when their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.7) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)
- Step 2: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.7)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. The core Clarity LIMS configuration for pooling handles this functionality.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (ul):: *= 0.7;
};
```

```
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22;
step.::PhiX Volume (ul):: *= 0.8;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30;
step.::PhiX Volume (ul):: *= 1.1;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> For accurate pipetting of each sample in a pool, the Per Sample Volume (µl) value must be greater than or equal to the Minimum Per Sample Volume (µl). The default value (set at 5) can be edited.
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step.

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists field configuration details defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step.

Table 128 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric		Range = 0–100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step.

Table 129 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.7)

In this step, the addition of DPX, NaOH, Tris-HCl, and RSB denatures and dilutes the pooled samples. Manually create working pools based on the number of lanes that you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4). The automation also validates that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
```

```
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (ul):: = 18 ;
output.::NaOH Volume (ul):: = 4;
output.::Tris-HCl Volume (ul):: = 5;
step.::DPX1 Volume (ul):: = 126 ;
step.::DPX2 Volume (ul):: = 18 ;
step.::DPX3 Volume (ul):: = 66 ;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (ul):: = 18;
output.::NaOH Volume (ul):: = 4;
output.::Tris-HCl Volume (ul):: = 5;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (ul):: = 22;
output.::NaOH Volume (ul):: = 5;
output.::Tris-HCl Volume (ul):: = 6;
step.::DPX1 Volume (ul):: = 126;
```

For Research Use Only. Not for use in diagnostic procedures.

```
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (ul):: = 30;
output.::NaOH Volume (ul):: = 7;
output.::Tris-HCl Volume (ul):: = 8;
step.::DPX1 Volume (ul):: = 315;
step.::DPX2 Volume (ul):: = 45;
step.::DPX3 Volume (ul):: = 165;
output.::Mastermix per Lane (ul):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. This file contains information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the Load to Flowcell (NovaSeq 6000 v3.7) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
-o {compoundOutputFileLuid0}.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
-o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists field configuration details defined on the Load to Flowcell (NovaSeq 6000 v3.7) step. A script sets these field values. The values are not editable while running the step.

Table 130 Dilute, Denature, and ExAmp (NovaSeq v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step.

Table 131 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

Refer to Run Dilute, Denature & ExAmp (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Step 3: Load to Flowcell (NovaSeq 6000 v3.7)

In this step, scan the flow cell barcode into the Clarity LIMS. Then, manually place the working pools into the lanes of the flow cell for the NovaSeq run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` and `validateSelectedContainer` scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Z0-9]{5}DR[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-
Z0-9]{5}DM[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-
Z0-9]{5}DS[A-Z0-9]{2}:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
```

```
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 416.
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters
are: a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if
Single Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
```

```
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error displays.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End
is True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be
defined if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.

  If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, the automation generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validates UMI Settings:
  - If UMI - Read 1 Length has value, UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, UMI - Read 2 Length must not have value.

For Research Use Only. Not for use in diagnostic procedures.

- If UMI - Read 1 Start From Cycle has no value, UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::)
};
```

- Validates Analysis Software Version to make sure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed characters are 0-9 and period. It shall start and end with numbers and separated by single period e.g. 3.8.4::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

- Checks Override Cycles field value. This value can contain only Y, N, I, U, 0–9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet when UMI - Read 1 Length or UMI - Read 2 Length have values.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to ADVANCE, which advances to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. The sample sheet template depends on the selected value for Samplesheet Format and/or Reverse Complete Workflow. For more information, refer to *Sample Sheet Generation* on page 415.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\

```

Master Step Fields

The following table lists the field configuration details defined on the Load to Flowcell (NovaSeq 6000 v3.7) step.

Table 132 Load to Flowcell (NovaSeq 6000 v3.7) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Library Tube Barcode	Text	Required Field	
Output Folder	Text	Required Field	
Override Cycles	Text		
Paired End	Text Dropdown	Required Field	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Settings Header (not displayed in user interface)	Text	Read Only	

Field Name	Field Type	Options	Additional Options and Dropdown Items
UMI - Read 1 Length	Numeric		Range = 1
UMI - Read 1 Start From Cycle	Numeric		Range = 1
UMI - Read 2 Length	Numeric		Range = 1
UMI - Read 2 Start From Cycle	Numeric		Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value provided in the *Validation Script* on page 411 section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if

step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep =
::ADVANCE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.7) step.

Table 133 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Load to Flowcell (NovaSeq 6000 v3.7) step section in *NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting* on page 429.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

This final protocol contains one fully automated step, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7), described in the following section.

This step is fully automated. Do not add samples to the Ice Bucket or start the step manually. The sequencing service does not update samples correctly when they have been manually started.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

By default, the Set Next Steps automation is disabled (set to Not Used) and the Sequencer API sets the next step for samples.

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configuring Autocomplete Properties* on page 594.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following fields are configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step in Clarity LIMS:

- Current Cycle
- Current Read
- Firmware Version
- Flow Cell Expiration Date
- Flow Cell ID
- Flow Cell Lot Number
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Side
- Instrument Control Software Version
- Instrument ID
- Instrument Type

- Lane Counter
- Loading Workflow Type
- Output Folder
- RTA Version
- Run Completion Date
- Run ID
- Run Status
- Sequencing Log

Global Fields

The following fields are used to capture the run metrics in Clarity LIMS:

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeq Integration v3.5.1 configuration provided in the Illumina Preset Protocols (IPP) v2.5 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable through the Custom Fields screen in the Global Fields tab.
- If field names are changed in Clarity LIMS, they must also be changed through the `run.metricUdfNames` properties file in the `application.yml` file for the Sequencer API. For more information, refer to the *application.yml Properties* section in *Components Installed* on page 421. All fields are configured to be visible in the Sample Details table on the Record Details screen for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

These global custom fields are configured on the Container entity, visible on each input, but they should not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq Control Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run. This step is Dilute and Denature (NovaSeq 6000 v3.7) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.7) in the NovaSeq Xp protocol. This step places samples on the library tube or flow cell that are loaded in the NovaSeq 6000 instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one CSV format sample sheet file. The bcl2fastq v2.20 downstream analysis uses this file.

The sample sheet is uploaded to the NVCS via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from the Clarity LIMS using OAuth (instead of Basic Authentication), which is required for the NovaSeq 6000 instrument.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The following master step fields control the sample sheet content. These fields display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles

- Workflow
- Reverse Complement Workflow
- Samplesheet Format

Depending on Samplesheet Format field value selection, a v1 or v2 sample sheet is generated. For detailed information on the following items, refer to the *Bcl2fastq2 Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000 Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000 instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at `/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen to the user. Log in to authorize the NVCS to use your account automatically to access Clarity LIMS.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact the Clarity LIMS at `http://localhost:9080/clarity/`. The installation script sets this URL, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 421.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
   - If authentication fails, the user is left on the login screen, and a warning message informs them of the failure. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000 of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The `sequencing-run/recipe/novaseq` endpoint consumes a POST request with a LibraryContainerId, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagent information is provided by the NovaSeq 6000.
   - LibraryContainerId and FlowCellId can match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 421.
3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API. Then, the run recipe is generated.
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.7) or Load to Flowcell (NovaSeq 6000 v3.7) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.7 workflow configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe. The value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 421. If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Content

The sample sheet content and the fields configured on the Dilute and Denature (NovaSeq 6000 v3.7) and Load to Flowcell (NovaSeq 6000 v3.7) steps control the content of the run recipe.

The following example shows the run recipe content:

```
{
"run_name": "NVCS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found, or if the samples in the container are incorrectly queued, an error occurs and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged. The API cannot complete the step without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored. A warning is logged during lot tracking.
3. The type of flow cell being used in the run determines the number of replicates for the step.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged, and the reagent is ignored.
   - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and 2.
   - Name—Serial number in request
   - Lot Number—Lot number in request
   - Expiry—Expiry date in request
   - Status—Active

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.

For Research Use Only. Not for use in diagnostic procedures.

6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 420.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 420.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Find the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, the Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If you end a sequencing run, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000 Integration v3.5.1 is distributed as the `BaseSpaceLIMS-sequencer-api` RPM package. This RPM package must be installed on the Clarity LIMS server.

The `BaseSpaceLIMS-sequencer-api` RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- Two configuration scripts: `configure_sequencer_api_proxy.sh` and `configure_sequencer_api_application.sh`

The NovaSeq 6000 v3 configuration is delivered through Illumina Preset Protocols (IPP) v2.5, which requires installation of the NGS Extensions Package v5.22.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.22.0 is installed, the latest version is installed by default with the NovaSeq 6000 integration. For more information, refer to *NovaSeq 6000 Integration v3.5.1 Release Notes* on page 453.
- If NGS Extensions Package v5.22.0 or later is already installed, the upgrade is not forced or required.

NovaSeq 6000 Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for Sequencer API v2.4.1.

Files Installed	Location and Description
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMS Tomcat configuration to include Secret Util settings.
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API v2.4.1 application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with the Clarity LIMS.

application.yml Properties

The `application.yml` file is at `opt/gls/clarity/extensions/sequencer-api/`.

- All properties are configured automatically during installation, but they can also be configured by editing the `application.yml` file and then restarting Tomcat.
- Properties in the file represent all custom field names, both for recipe and run information.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 134 application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default (do not change) • tomcat
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (`configure_sequencer_api_application`) prompts for this URL.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that is used when signing/validating OAuth tokens. Changing this key invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default • 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration can find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line must be indented to the same point and start with a dash (-). Default - "AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)" - "AUTOMATED - NovaSeqDx Run (NovaSeqDx v1.1)"

novaseq.flowcells	List of supported NovaSeq flow cell types.
	• Type names exactly match the values used by the NVCS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4"`
	`lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	• **- lotName**—The name of the lot as it appears in the run started request.
	• - kitName—The name of the corresponding reagent kit in Clarity LIMS that the lot is tracked as.
	• The name can differ in the NVCS request versus the Clarity LIMS configuration.
	Default
	`- lotName: "Buffer"`
	`kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to the *Run Recipe Contents* section of *NovaSeq 6000 Run* on page 416. • Each value must be enclosed in quotes (eg, recipe.udfNames.runMode "Run Mode"). • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, recipe.udfNames.sampleLoadingType "Loading Workflow Type").
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

Property	Description
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* on page 412. • Each value must be enclosed in quotes (eg, run.stepUdfNames.runID "Run ID") • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, run.stepUdfNames.sampleLoadingType "Loading Workflow Type"). It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file custom fields/measurement global field names to be used when recording run results. These fields capture the run data. For more information, refer to the *Global Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)* on page 412.
run.autoComplete	Determines whether the sequencing run step must be completed automatically after parsing the run metrics on a run along with run.autoCompleteOnlyAtSuccess. For more information, refer to *Configuring autoComplete Properties* on page 427. Default • true

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.autoCompleteOnlyAtSuccess	Determines which of the following options that the sequencing run step must be: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). For more information, refer to *Configuring autoComplete Properties* on page 427. Default • true

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the format [A-Z]{2}[0-9]{7}-[A-Z]{3} (eg, AB1234567-XYZ)
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DR[A-Z0-9]{2}
  - S2 flow cell: [A-Z0-9]{5}DM[A-Z0-9]{2}
  - S4 flow cell: [A-Z0-9]{5}DS[A-Z0-9]{2}
  - Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

1. On the steps that use the routing script (Define Run Format (NovaSeq 6000 v3.7) and Dilute and Denature (NovaSeq 6000 v3.7), the Next Step for all samples must be set to Remove from workflow. A script sets this value. The value must not change in the Assign Next Steps screen.
2. In the Next Steps section of the protocol configuration screen, the method of assigning the next step must be set to Automation for the last step of the protocol.

Configuring autoComplete Properties

As of NovaSeq Integration v3.5.1, the `application.yml` configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow (AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)) is automatically completed when the run status is "RunCompletedSuccessfully" (default behavior) or regardless of the run status.

By default, both properties are set to true and the step only completes when the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

For the step to autoComplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.

3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 135 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete Property Value	run.autoCompleteOnlyAtSuccess Property Value	Outcome
true	true	• Step automatically completes only if sequencing run is successful. • If run is not successful, step does not automatically complete, and the run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There must not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542.

- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step. This step is a fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, Validate Run Setup and Generate Sample Sheet must be selected.

NovaSeq 6000 Integration v3.5.1 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.5.1.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.7 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.7) step to the NovaSeq Standard (NovaSeq 6000 v3.7) or NovaSeq Xp (NovaSeq 6000 v3.7) step.
  - Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the Illumina NovaSeq 6000 Integration Package v3.5.1 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000 v3.7 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation and NovaSeq 6000 v3.7 workflows.
   - Library Prep Validation v2.3.0 is available with Illumina Preset Protocols (IPP) v2.5.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

For Research Use Only. Not for use in diagnostic procedures.

Library Prep Protocol: Library Prep Validation v2.3.0

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.7 workflow.

Run Library Prep Validation v2.3.0

1. In Lab View, locate the Library Prep Validation v2.3.0 protocol.
   Samples are queued for the Library Prep Validation v2.3.0 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, and drag them to the container wells on the right side.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

   If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

   a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
   b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.

For Research Use Only. Not for use in diagnostic procedures.

c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
   Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.7 workflow, Define Run Format (NovaSeq 6000 v3.7). This step is the only one in Protocol 1: Run Format (NovaSeq 6000 v3.7).

Protocol 1: Run Format (NovaSeq 6000 v3.7)

This protocol includes a single step, Define Run Format (NovaSeq 6000 v3.7). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v3.7)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.7) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.7) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.

- Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.

5. Select Next Steps, which triggers the Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (an empty value not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. Also, a message is recorded in the Warning field for the sample.
     At this point, there are two options:
     - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
     - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step. This step is the first one in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step. This step is the first one in the NovaSeq Xp protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.7)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run.

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7)

1. In Lab View, locate the NovaSeq XP (NovaSeq 6000 v3.7) protocol. Samples for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.7) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
      After exiting from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the PhiX Volume (µl) value when % PhiX (2.5 nM) Spike-In has value.
- Calculates the Per Sample Volume (µl) value to be added to the pool.
- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, selects the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples that it contains. Select on the file to download it and then open it in Excel.

8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.7).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.7).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.7) step.

Step 2: Run Dilute and Denature (NovaSeq 6000 v3.7)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.7) protocol. The pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.7) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}. If it does not, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.

To add and activate reagent lots:

a. In a new browser tab, open an additional instance of Clarity LIMS.
b. Navigate to the Consumables configuration screen.
c. Select the NaOH reagent kit and select New Lot.
d. Enter the lot details.
e. Set the Status of Reagent Lot toggle switch to Active.
f. Select Save.
g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
h. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 136 Fields Displayed on Record Details Screen of Denature and Dilute (NovaSeq 6000 v3.7)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20

Field	Value
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.

Field	Value
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This selection triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

   - Select Next Steps.
9. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

10. Select Finish Step.
    After exiting the step, the following actions occur:
    - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

For Research Use Only. Not for use in diagnostic procedures.

At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step. The integration adds samples automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.7)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The option selected in the Define Run Format (NovaSeq 6000 v3.7) step determines the flow cell type.

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.7) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.7) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, create and name a pool as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      Create only one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

- If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
- Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch. This adjustment is based on the ratio used to increase the lowest value to 5.

7. In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes. This selection triggers the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value when % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculate the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:
   - Copies the Flowcell Type values from the step inputs to the step outputs.
   - Sets the next step for samples to ADVANCE, advancing them to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step in the protocol.

   On the Assign Next Steps screen, the next step for samples is set to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step in the workflow.
10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.7)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.7) protocol. The pool of samples queued for the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.7) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.

3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (see the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Select Save.
   f. Repeat this process to add and activate the remaining reagent lots.
   g. Return to your original working browser tab and refresh the page.
6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are prepopulated. The script sets the values and they are not editable.
   - In the Sample Details table, select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. The script sets the values and they are not editable.

- The Flowcell Type and Loading Workflow Type columns are populated.
- The working pool number is appended to the bulk pool name, to identify which working pools are derived from the same bulk pool.

7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.7).
9. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.7)

1. On the Ice Bucket screen:
   - In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   - Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag one or more pools from the left of the screen over into the Placed Samples area on the right.
   - Scan or type the barcode of the flow cell into the Flowcell field.
   - Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type (as listed in the following table). This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DR[A-Z0-9]{2}
S1	[A-Z0-9]{5}DR[A-Z0-9]{2}
S2	[A-Z0-9]{5}DM[A-Z0-9]{2}
S4	[A-Z0-9]{5}DS[A-Z0-9]{2}

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. For details, refer to the following table:

   Table 137 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.7) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Library Tube Barcode	Scan the library tube barcode.
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet to trigger the automation script, which does the following:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but the various stages can be reviewed in Clarity LIMS under Review Run Data.

Automations

The NovaSeq Run (NovaSeq 6000 v3.7) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) include a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step. You can use this automation to override the default next step behavior. For details, refer to *NovaSeq 6000 Integration v3.5.1 Configuration and User Interaction* on page 369for details.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen.
  Do not disable or modify this automation to make sure that the Lane Number displays properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate in the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version

- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global fields listed. Values are aggregated across all lanes. Some values (for example Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000 Integration v3.5.1 Configuration and User Interaction* on page 369.

1. When setting up a run on the NovaSeq 6000 instrument, NVCS sends a request for the run recipe.
    a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step.

b. Clarity LIMS sends a JSON response to NVCS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).

2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates and enables it on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.
4. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends a request only when the run completed successfully, but the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following actions:
   a. Records the metrics into the fields on file placeholder outputs in the LIMS.
   b. Completes the step in Clarity LIMS when the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For details, refer to *NovaSeq 6000 Integration v3.5.1 Configuration and User Interaction* on page 369.

   > *NovaSeq 6000 Integration v3.5.1 Configuration and User Interaction* on page 369 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq 6000 run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Informatics*
- *Troubleshooting Automation in the API*

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq 6000 Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step, review the log file information. For details, refer to *Logging* on page 448.

If the automated run step starts but does not complete, proceed as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS, using either the Library Tube, or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If you are unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging* on page 448.
3. Contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.7) step, the Sequencer API writes a detailed log file to the following location:

`/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`

Log messages include the Library Tube ID and Flowcell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most the log

messages for this request. However, if all messages for downloading a file are found, the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (also included in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started

```

NovaSeq 6000 Integration v3.5.1 Manual Upgrade

NovaSeq Integration Package v3.5.1 contains modifications to the existing automations from NovaSeq Integration Package v3.5.0.

If you do not want to upgrade the existing NovaSeq Sequencing workflow to the latest version through Illumina Preset Protocols (IPP), you can update the workflow configuration manually by completing the following steps.

Update Calculate Volumes Automation on Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5.0) Step

Update the Calculate Volumes automation on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5.0) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Calculate Volumes automation that is enabled on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5.0) master step.
3. Update the existing command line at the second -exp script as follows.
   Changes are highlighted in red.

```
-exp 'step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ?
0 : step.::% PhiX (2.5nM) Spike-In::; if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9 }; if (input.::Flowcell Type:: == ::S4::) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9 }; if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = :::: }; input.::Per Sample Volume (ul):: =
(((input.::Final Loading Concentration (pM):: * 5 / 1000) / input.::Normalized
Molarity (nM)::) * step.::Bulk Pool Volume (ul)::) / step.::Number of Samples in
Pool::' \
```

4. Update the existing command line at the fourth -exp script as follows.
   Changes are highlighted in red.

```
-exp 'if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0} else {output.::RSB Volume (ul):: = step.::Bulk
Pool Volume (ul):: - step.::Total Sample Volume (ul)::} ; output.::Flowcell
Type:: = input.::Flowcell Type:: ; output.::Loading Workflow Type:: =
input.::Loading Workflow Type:: ; if ( input.::Flowcell Type:: == ::SP:: ) {
output.::Volume of Pool to Denature (ul):: = 100 ; output.::NaOH Volume (ul):: =
25 ; output.::Tris-HCl Volume (ul):: = 25 } ; if ( input.::Flowcell Type:: ==
::S1:: ) { output.::Volume of Pool to Denature (ul):: = 100 ; output.::NaOH
Volume (ul):: = 25 ; output.::Tris-HCl Volume (ul):: = 25 } ; if (
input.::Flowcell Type:: == ::S2:: ) {output.::Volume of Pool to Denature (ul)::
= 150 ; output.::NaOH Volume (ul):: = 37 ; output.::Tris-HCl Volume (ul):: = 38
} ; ; if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to
Denature (ul):: = 310 ; output.::NaOH Volume (ul):: = 77 ; output.::Tris-HCl
Volume (ul):: = 78 }' \
```

5. Select Save.

Update Calculate Volumes Automation on Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5.0) Step

Update the Calculate Volumes automation on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5.0) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Calculate Volumes automation enabled on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5.0) step.
3. Update the existing command line at the second -exp script as follows.
   Changes to the existing command line are in red.

```
-exp 'step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ?
0 : step.::% PhiX (0.25nM) Spike-In::; if (input.::Flowcell Type:: == ::SP::) {

Update Calculate Volumes Automation on Dilute, Denature & ExAmp (NovaSeq 6000 v3.5.0) Step

Update the Calculate Volumes automation on the Dilute, Denature & ExAmp (NovaSeq 6000 v3.5.0) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Calculate Volumes automation enabled on the Dilute, Denature & ExAmp (NovaSeq 6000 v3.5.0) step.
3. Update the existing command line at the first -exp script as follows.
   Changes to the existing command line are in red.

```
-exp 'if ( input.::Flowcell Type:: == ::SP:: ) { output.::BP Aliquot Volume
(ul):: = 18 ; output.::NaOH Volume (ul):: = 4 ; output.::Tris-HCl Volume (ul)::
= 5 ; step.::DPX1 Volume (ul):: = 126 ; step.::DPX2 Volume (ul):: = 18 ;
step.::DPX3 Volume (ul):: = 66 ; output.::Mastermix per Lane (ul):: = 63} ; if (
input.::Flowcell Type:: == ::S1:: ) { output.::BP Aliquot Volume (ul):: = 18 ;
output.::NaOH Volume (ul):: = 4 ; output.::Tris-HCl Volume (ul):: = 5 ;

NovaSeq 6000 Integration v3.5.1 Release Notes

These release notes describe the key changes to software components for the Clarity LIMS NovaSeq 6000 Integration Package.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v5.1 and later
- NGS Extensions Package v5.22 and later
- Illumina Preset Protocols (IPP) v2.5.0 and later
- NovaSeq Control Software (NVCS) v1.8.0
- Illumina bcl2fastq v2.20

New Features

Features provided with this release of the integration package are as follows.

- Updates to the Validate Flowcell Barcode automation (in the Load to Flowcell step of the NovaSeq Xp protocol) to support future flow cell barcode formats.
- Vulnerability fixes for Denial of Service (CVE-2022-22970) and Integer Overflow (CVE-2022-22976).

Defects Fixed

Fixed the following Calculate Volumes automation script values to sync with the *NovaSeq 6000 System Denature and Dilute Libraries Guide (document # 1000000106351)*:

- PhiX
- NaOH
- Tris-HCl
- Bulk pool volume

Known Issues

None

For Research Use Only. Not for use in diagnostic procedures.

NovaSeq 6000 Integration v3.5.0 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.5.0 supports the integration of Clarity LIMS to Illumina NovaSeq 6000 instruments. This integration supports Clarity v5.1 and later.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, refer to *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows - including renaming protocols, steps, and fields - could break process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq 6000 v3.5 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.5)
  - NovaSeq Standard (NovaSeq 6000 v3.5) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.5) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)
- Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file is automatically uploaded to the instrument via the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
  - [Optional] Preconfigured Library Prep Validation v2.2.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to

produce normalized libraries that are ready for the NovaSeq 6000 v3.5 workflow. For more information, refer to *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514. The Library Prep Validation v2.2.0 workflow is available in IPP v2.4 Package.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.5 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.5.0 includes the following workflows:

- NovaSeq 6000 v3.5
- Library Prep Validation v2.2.0 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 138 NovaSeq 6000 Integration Package v3.5.0 Protocols and Steps

Protocol Name	Protocol Purpose	Steps Included in Protocol
Library Prep Validation v2.2.0 Workflow		
Library Prep Validation v2.2.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.5) protocol. The protocol contains a single step - Library Prep Validation v2.2.0. After this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.5 workflow - Define Run Format (NovaSeq 6000 v3.5).	1. Library Prep Validation v2.2.0
NovaSeq 6000 v3.5 Workflow		

Protocol Name	Protocol Purpose	Steps Included in Protocol
Run Format (NovaSeq 6000 v3.5)	Allows for the assignment of per sample values for: • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.5)
NovaSeq Standard (NovaSeq 6000 v3.5)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) 2. Dilute and Denature (NovaSeq 6000 v3.5)
NovaSeq Xp (NovaSeq 6000 v3.5)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.5) step. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) 2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) 3. Load to Flowcell (NovaSeq 6000 v3.5)

Protocol Name	Protocol Purpose	Steps Included in Protocol
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)

Validation Workflow

The Library Prep Validation v2.2.0 workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v3.5 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, refer to *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Table 139 NovaSeq 6000 v3.5 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.5)	1. Define Run Format (NovaSeq 6000 v3.5)	Routing Script Set Next Steps

Protocol	Step	Automation
2. NovaSeq Standard (NovaSeq 6000 v3.5)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute and Denature (NovaSeq 6000 v3.5)	Routing Script Check Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.5)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.5)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)	Update Lane Number Set Next Steps (Not used. By default, this functionality is determined by the Sequencer API. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Terminology

This integration package supports BaseSpace Clarity LIMS v5.1 and later.

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.5)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.5) or the NovaSeq Xp (NovaSeq 6000 v3.5) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.5).

Step 1. Define Run Format (NovaSeq 6000 v3.5)

Step input: NTP (normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) { fail(::The Normalized
Molarity cannot be empty.::) ; }
```

- Compares each sample Normalized Molarity value with the Minimum Molarity value. If Normalized Molarity value is lower than the Minimum Molarity value, it sets the samples Loading Workflow Type to [Remove from workflow] and records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
input.::Warning:: = ::The Normalized Molarity is too low.:: ;
input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; }
else { input.::Warning:: = ::n/a:: }
```

At this point there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.5 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.5 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step.

Default automation command line is as follows:

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.5' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.5' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

For Research Use Only. Not for use in diagnostic procedures.

Master Step Fields

The following table lists field configuration details defined on the Define Run Format (NovaSeq 6000 v3.5) master step.

Table 140 Define Run Format (NovaSeq 6000 v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text		None
Flowcell Type	Text Dropdown	Required Field Custom Entries	Presets • SP • S1 • S2 • S4
Instruction	Text	Read Only	Default • Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.5) step.

Table 141 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Decimal places displayed = 0 Presets • 225 • 400

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Warning	Text Dropdown	Read Only Custom Entries	The Normalized Molarity (nM) is too low. Not applicable

User Interaction

Refer to Run Define Run Format (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.5)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.5)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. This functionality is handled by the core Clarity LIMS configuration for pooling.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when selecting the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (ul):: *= 0.8
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (ul):: *= 0.8
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150
+ 30;
step.::PhiX Volume (ul):: *= 1.1
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310
+ 30;
step.::PhiX Volume (ul):: *= 2.1
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value, set at 5, may be edited).
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

For Research Use Only. Not for use in diagnostic procedures.

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0}
else {output.::RSB Volume (ul):: = step.::Bulk Pool Volume (ul):: - step.::Total
Sample Volume (ul)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value and calculates the NaOH Volume (µl) and Tris-HCl Volume (µl) values based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume
(ul):: = 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) { output.::Volume of Pool to Denature
(ul):: = 150 ; output.::NaOH Volume (ul):: = 37.50 ; output.::Tris-HCl Volume
(ul):: = 37.50 } ;
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(ul):: = 310 ; output.::NaOH Volume (ul):: = 77.50 ; output.::Tris-HCl Volume
(ul):: = 77.50 }
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of Dilute and Denature (NovaSeq 6000 v3.5).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
-o 1.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
-o 2.csv \
```

```
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
-o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.5):

```
nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists configuration details defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step.

Table 142 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric		Range = 0–100 Decimal places displayed = 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Minimum Per Sample Volume (µl)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step.

Table 143 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

Field Name	Field Type	Options	Additional Options and Dropdown Items
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	Read Only	Decimal places displayed = 0

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Step 2: Dilute and Denature (NovaSeq 6000 v3.5)

In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB). Manually place the pooled samples into the library tube for the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}:

```
if (!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::)) {
fail(::Invalid Library Tube Barcode. Verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit.

- If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.
- The script definition portion of the Generate Sample Sheet remains untouched.

Triggered by a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 501.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
```

```
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is zero, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowc ell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validates UMI Settings.
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Validate Override Cycles value to only contain Y, N, I, U, 0-9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to REMOVE.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. For more information, refer to *Sample Sheet Generation* on page 500. Sample sheet template used depends on the selected value of Samplesheet Format and/or Reverse Complement Workflow.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
```

```
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeq 6000 v3.5 workflow and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

Default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2}
script:changeWorkflow \
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.5' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

The following table lists field configuration details cdefined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step. These fields are required for sample sheet and JSON file generation.

Table 144 Dilute and Denature (NovaSeq 6000 v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		Only applicable for v2 sample sheet. Otherwise, leave this field blank.
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Output Folder	Text	Required Field	
Override Cycles	Text		Only applicable for v2 sample sheet. Otherwise, leave this field blank.
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycle	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (Not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Setting Header (not displayed in user interface)	Text	Read Only	
UMI - Read 1 Length	Numeric	Custom Entries	Range = 1
UMI - Read 1 Start From Cycle	Numeric	Custom Entries	Range = 1
UMI - Read 2 Length	Numeric	Custom Entries	Range = 1
UMI - Read 2 Start From Cycle	Numeric	Custom Entries	Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • None Set
Validation Script	Multiline Text	Required Field Read Only	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if (step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
```

```
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if

step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep =
::REMOVE::
```

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.5) step.

For Research Use Only. Not for use in diagnostic procedures.

Table 145 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Dilute and Denature (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.5)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.5) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5)
- Step 2: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.5)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. This functionality is handled by the core Clarity LIMS configuration for pooling.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
```

```
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30 + 30;
step.::PhiX Volume (ul):: *= 2.2;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value set at 5, may be edited).
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step.

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
```

```
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \

  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (µl) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table provides field configuration details fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step.

Table 146 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric		Range = 0–100

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Additional Options and Dropdown Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (uL)	Numeric	Required Field	Decimal places displayed = 2 Default • 5
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 0 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step.

Table 147 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			

Field Name	Field Type	Options	Additional Options and Dropdown Items
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.5)

In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. Manually create working pools based on the number of lanes you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
```

```
-l {compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (ul):: = 18 ;
output.::NaOH Volume (ul):: = 4.50 ;
output.::Tris-HCl Volume (ul):: = 4.50 ;
step.::DPX1 Volume (ul):: = 126 ;
step.::DPX2 Volume (ul):: = 18 ;
step.::DPX3 Volume (ul):: = 66 ;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (ul):: = 18;
output.::NaOH Volume (ul):: = 4.50;
output.::Tris-HCl Volume (ul):: = 4.50;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (ul):: = 22;
output.::NaOH Volume (ul):: = 5.50;
output.::Tris-HCl Volume (ul):: = 5.50;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
```

For Research Use Only. Not for use in diagnostic procedures.

```
output.::Mastermix per Lane (ul):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (ul):: = 30;
output.::NaOH Volume (ul):: = 7.50;
output.::Tris-HCl Volume (ul):: = 7.50;
step.::DPX1 Volume (ul):: = 315;
step.::DPX2 Volume (ul):: = 45;
step.::DPX3 Volume (ul):: = 165;
output.::Mastermix per Lane (ul):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file containing information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the Load to Flowcell (NovaSeq 6000 v3.5) step.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
-o {compoundOutputFileLuid0}.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
-o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table lists field configuration details defined on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step. These field values are set by a script and are not editable while running the step.

Table 148 Dilute, Denature, and ExAmp (NovaSeq v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step.

Table 149 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

Field Name	Field Type	Options	Additional Options and Dropdown Items
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

Refer to Run Dilute, Denature & ExAmp (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Step 3: Load to Flowcell (NovaSeq 6000 v3.5)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeq run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` and `validateSelectedContainer` scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user, using the following logic:

if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches(::[A-Z0-9]{5}DRX[XY2357]::)) {

fail (::Invalid Flowcell Barcode. Please verify and try again.::)

};

if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches(::[A-Z0-9]{5}DRX[XY2357]::)) {

fail (::Invalid Flowcell Barcode. Please verify and try again.::)

};

if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches(::[A-Z0-9]{5}DMX[XY2357]::)) {

fail (::Invalid Flowcell Barcode. Please verify and try again.::)

};

if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches(::[A-Z0-9]{5}DSX[XY2357]::)) {

fail (::Invalid Flowcell Barcode. Please verify and try again.::)

};

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.

For Research Use Only. Not for use in diagnostic procedures.

- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. For more information, refer to the *Respond to Validation / Recipe Request Call from Instrument* section of *NovaSeq 6000 Run* on page 501.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters
are: a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if
Single Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error displays.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End
is True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be
defined if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validates UMI Settings:
  - If UMI - Read 1 Length has value, UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI
- Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Validates Analysis Software Version to make sure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Checks Override Cycles field value. This value can contain only Y, N, I, U, 0–9, and semicolon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet when UMI - Read 1 Length or UMI - Read 2 Length have values.

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to ADVANCE, which advances to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. The sample sheet template depends on the selected value for Samplesheet Format and/or Reverse Complete Workflow. For more information, refer to *Sample Sheet Generation* on page 500.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Master Step Fields

There are 27 fields defined on the Load to Flowcell (NovaSeq 6000 v3.5) step.

The following table lists the field configuration details.

Table 150 Load to Flowcell (NovaSeq 6000 v3.5) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text		Only applicable for the V2 sample sheet. Otherwise, leave this field blank.

Field Name	Field Type	Options	Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text		
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Library Tube Barcode	Text	Required Field	
Output Folder	Text	Required Field	
Override Cycles	Text		Only applicable for the V2 sample sheet. Otherwise, leave this field blank.
Paired End	Text Dropdown	Required Field	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required Field	Presets • V1 (default) • V2
Settings Header (not displayed in user interface)	Text	Read Only	

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
UMI - Read 1 Length	Numeric		Range = 1
UMI - Read 1 Start From Cycle	Numeric		Range = 1
UMI - Read 2 Length	Numeric		Range = 1
UMI - Read 2 Start From Cycle	Numeric		Range = 1
Use Custom Index Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 1 Primer	Toggle Switch		Default • None Set
Use Custom Read 2 Primer	Toggle Switch		Default • None Set
Use Custom Recipe	Toggle Switch	Required Field	Default • No
Validation Script	Multiline Text	Required Field Read Only	Default value provided in the *Validation Script* on page 496 section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index • Custom

For Research Use Only. Not for use in diagnostic procedures.

Validation Script

step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::) }; step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep = ::ADVANCE::

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.5) step.

For Research Use Only. Not for use in diagnostic procedures.

Table 151 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Analyte in Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Load to Flowcell (NovaSeq 6000 v3.5) step section in *NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting* on page 514.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)

This final protocol contains one fully automated step, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5), described in the following section.

This is a fully automated step. Do not add samples to the Ice Bucket or start the step manually. The sequencing service does not update samples correctly if they have been manually started.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

By default, the Set Next Steps automation is disabled (set to Not Used) and the Sequencer API sets the next step for samples.

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.

2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, refer to *Configuring autoComplete Properties* on page 512.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following fields are configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step in Clarity LIMS:

- Current Cycle
- Current Read
- Firmware Version
- Flow Cell Expiration Date
- Flow Cell ID
- Flow Cell Lot Number
- Flow Cell Mode
- Flow Cell Part Number
- Flow Cell Side
- Instrument Control Software Version
- Instrument ID
- Instrument Type
- Lane Counter
- Loading Workflow Type
- Output Folder
- RTA Version
- Run Completion Date
- Run ID
- Run Status
- Sequencing Log

Global Fields

The following fields are used to capture the run metrics in Clarity LIMS:

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following details:

- Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeq Integration v3.5.0 configuration provided in the Illumina Preset Protocols (IPP) v2.4 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable through the Custom Fields screen in the Global Fields tab.

- If field names are changed in Clarity LIMS, they must also be changed through the `run.metricUdfNames` properties file in the `application.yml` file for the Sequencer API. For more information, refer to the *application.yml Properties* section in *Components Installed* on page 506. All fields are configured to be visible in the Sample Details table on the Record Details screen for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

These global custom fields are configured on the Container entity, visible on each input, but they should not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq Control Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run, which is Dilute and Denature (NovaSeq 6000 v3.5) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.5) in the NovaSeq Xp protocol. This step places samples on the library tube or flow cell that are loaded in the NovaSeq 6000 instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one CSV format sample sheet file for use with bcl2fastq v2.20 downstream analysis.

The sample sheet is uploaded to the NVCS via the `/Illumina/Sequencer/v2/sequencing-run/files` endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from the Clarity LIMS using OAuth (instead of Basic Authentication), which is required for the NovaSeq 6000 instrument.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The sample sheet content is controlled by the following master step fields that display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow
- Reverse Complement Workflow
- Samplesheet Format

Depending on Samplesheet Format field value selection, a v1 or v2 sample sheet is generated. For detailed information on the following items, refer to the *Bcl2fastq2 Sample Sheet Generation* section of *Illumina Instrument Sample Sheets (NGS v5.17 and later)*:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq 6000 Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq 6000 instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at `/Illumina/Sequencer/v2/sequencing-run/login`). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen to the user. Log in to automatically authorize the NVCS to use your account to access the Clarity LIMS.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact the Clarity LIMS at `http://localhost:9080/clarity/`. This URL is set by the installation script, but it can be configured with the clarity.url property in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 506.
3. The user is redirected to the Sequencer login page at `/Illumina/Sequencer/v2/sequencer_login`.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to `/Illumina/Sequencer/v2/sequencer_login/Success`. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
   - If authentication fails, the user is left on the login screen and a warning message informs them of the failure. A background redirect to `/Illumina/Sequencer/v2/sequencer_login/Error` informs the NovaSeq 6000 of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The `sequencing-run/recipe/novaseq` endpoint consumes a POST request with a LibraryContainerI, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagent information is provided by the NovaSeq 6000.

- LibraryContainerId and FlowCellId should match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
- If there are no containers or multiple containers, an error is generated.

2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the `application.yml` file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 506.

3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API and the run recipe is generated.
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.5) or Load to Flowcell (NovaSeq 6000 v3.5) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.5.0 configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe and the value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the `application.yml` file. For more information, refer to the *application.yml Properties* section of *Components Installed* on page 506. If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Content

The content of the run recipe is controlled by the sample sheet content and the fields configured on the Dilute and Denature (NovaSeq 6000 v3.5) and Load to Flowcell (NovaSeq 6000 v3.5) steps:

The following example shows the run recipe content:

```
{
"run_name": "NVCS16027_SPrime_2x250",
"run_mode": "S4",
"workflow_type": "DualIndex",
"librarytube_id": "NV0025867-LIB",
"flowcell_id": "",
"sample_loading_type": "NovaSeqStandard",
"rehyb": false,
"paired_end": true,
"read1": 151,
"read2": 151,
"index_read1": 8,
"index_read2": 8,
"output_folder": "\\\\network_path\\run_data",
"samplesheet": "<path to sample sheet on LIMS server>",
"require_samplesheet_authentication": true,
"usecustomrecipe": false,
"customRecipe": null,
"use_basespace": false,
"basespace_mode": null,
"use_custom_read1_primer": false,
"use_custom_read2_primer": false,
"use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:

- If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
- If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
  - If a kit that is to be enabled is Archived, it is set to Active.
  - If a kit that is to be enabled is in Pending status, it is set to Active.
- If any kits enabled on the step are not configured for the Sequencer API, a warning is logged and the step cannot be completed by the API without user intervention.
- If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored and a warning is logged during lot tracking.

3. The number of replicates for the step is determined by the type of flow cell being used in the run.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged and the reagent is ignored.
   - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and 2.
   - Name—Serial number in request
   - Lot Number—Lot number in request
   - Expiry—Expiry date in request
   - Status—Active

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.
6. Master step custom fields are updated with the run information parsed from the request. For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 505.

7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). For more information, refer to *Respond to Record InterOps Metrics Call from Instrument* on page 505.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Find the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, the Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the sequencing run is ended by the user, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the various components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq 6000 Integration v3.5.0 is distributed as the `BaseSpaceLIMS-sequencer-api` RPM package. This RPM package must be installed on the Clarity LIMS server.

The `BaseSpaceLIMS-sequencer-api` RPM installs the following items:

- Sequencer API WAR file
- `application.yml` configuration file
- Two configuration scripts: `configure_sequencer_api_proxy.sh` and `configure_sequencer_api_application.sh`

The NovaSeq 6000 v3 configuration is delivered through Illumina Preset Protocols (IPP) v2.4 which requires installation of the NGS Extensions Package v5.22.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.22.0 is installed, the latest version is installed by default with the NovaSeq 6000 integration. For more information, refer to *NovaSeq 6000 Integration v3.5.0 Release Notes* on page 535.
- If NGS Extensions Package v5.22.0 or later is already installed, the upgrade is not forced or required.

NovaSeq 6000 Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
`Illumina#Sequencer#v2.war`	`/opt/gls/clarity/tomcat/current/webapps` War file for NovaSeq v3.5.0 API.

Files Installed	Location and Description
`configure_sequencer_api_application.sh`	`/opt/gls/clarity/config/` Script that configures the Sequencer API application through its external `application.yml` file.
`configure_sequencer_api_env.sh`	`/opt/gls/clarity/config/` Script that configures the Clarity LIMSTomcat configuration to include Secret Util settings.
`configure_sequencer_api_proxy.sh`	`/opt/gls/clarity/config/` Script that configures the proxy to allow communication with the Sequencer API (NovaSeq v3.5.0 API) application.
`sequencer-api.conf`	`/etc/httpd/clarity/` Proxy setting to communicate with the Clarity LIMS.

application.yml Properties

The `application.yml` file is located at `opt/gls/clarity/extensions/sequencing-api/`.

- All properties are configured automatically during installation, but they can also be configured by editing the `application.yml` file and then restarting Tomcat.
- All custom field names, both for recipe and run information, are represented by properties in the file.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 152 application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default • tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (`configure_sequencer_api_application`) prompts for this.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
clarity.username	Username to be used when communicating with Clarity LIMS.
security.signing-key	Private key that should be used when signing/validating OAuth tokens. Changing this invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default • 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration may find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line should be indented to the same point and start with a dash (-). Default - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)

novaseq.flowcells	List of supported NovaSeq flow cell types.
	• Type names exactly match the values used by the NVCS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4"`
	`lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	• **- lotName**—The name of the lot as it appears in the run started request.
	• - kitName—The name of the corresponding reagent kit in Clarity LIMS that the lot should be tracked as.
	• The name may differ in the NVCS request versus the Clarity LIMS configuration.
	Default
	`- lotName: "Buffer"`
	`kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"`
	`kitName: "Cluster Cartridge"`
	`- lotName: "SBS"`
	`kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. For more information, refer to the *Run Recipe Contents* section of *NovaSeq 6000 Run* on page 501. • Each value must be enclosed in quotes (eg, recipe.udfNames.runMode "Run Mode"). • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, recipe.udfNames.sampleLoadingType "Loading Workflow Type").
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.stepUdfNames	Configures the master step field names to be used when recording run results. For more information, refer to the *Master Step Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)* on page 497. • Each value must be enclosed in quotes (eg, run.stepUdfNames.runID "Run ID") • Value provided for sampleLoadingType must match the value provided in the run configuration (eg, run.stepUdfNames.sampleLoadingType "Loading Workflow Type"). It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file custom fields/measurement global field names to be used when recording run results. These are the fields that capture the run data. For more information, refer to the *Global Fields* section of *Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)* in *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)* on page 497.
run.autoComplete	Determines whether the sequencing run step should be completed automatically after parsing the run metrics on a run along with run.autoCompleteOnlyAtSuccess. For more information, refer to *Configuring autoComplete Properties* on page 512. Default • true

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.autoCompleteOnlyAtSuccess	Determines which of the following options the sequencing run step should be: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). For more information, refer to *Configuring autoComplete Properties* on page 512. Default • true

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the format [A-Z]{2}[0-9]{7}-[A-Z]{3} (eg, AB1234567-XYZ)
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Z0-9]{5}DRX[XY2357]
  - S2 flow cell: [A-Z0-9]{5}DMX[XY2357]
  - S4 flow cell: [A-Z0-9]{5}DSX[XY2357]
  - Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

1. On the steps that use the routing script Define Run Format (NovaSeq 6000 v3.5) and Dilute and Denature (NovaSeq 6000 v3.5), the Next Step for all samples must be set to Remove from workflow. This value is set by a script. The value must not change in the Assign Next Steps screen.
2. In the Next Steps section of the protocol configuration screen, the method of assigning the next step must be set to Automation for the last step of the protocol.

Configuring autoComplete Properties

As of NovaSeq Integration v3.5.0, the `application.yml` configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow (AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)) is automatically completed when the run status is "RunCompletedSuccessfully" (default behavior) or regardless of the run status.

By default, both properties are set to true and the step only completes when the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

For the step to autoComplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the `application.yml` file at `/opt/gls/clarity/extensions/sequencer-api/application.yml`:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.

3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autoComplete behavior of the sequencing step.

Table 153 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete Property Value	run.autoCompleteOnlyAtSuccess Property Value	Outcome
true	true	• Step automatically completes only if sequencing run is successful. • If run is not successful, step does not automatically complete and run details are recorded in Clarity LIMS.
true	false	• Step automatically completes, regardless of the run status.
false	true	• Step does not automatically complete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)*.

- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step. This step is a fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, Validate Run Setup and Generate Sample Sheet must be selected.

NovaSeq 6000 Integration v3.5.0 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.5.0.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.5 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.5) step to the NovaSeq Standard (NovaSeq 6000 v3.5) or NovaSeq Xp (NovaSeq 6000 v3.5) step.
  - Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the Illumina NovaSeq 6000 Integration Package v3.5.0 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000 v3.5 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation and NovaSeq 6000 v3.5 workflows.
   - Library Prep Validation v2.2.0 is available with IPP v2.4.
2. On the Projects and Samples screen, create a project and add samples to it.

3. Assign the samples to the Library Prep Validation workflow. The workflow must be activated before you can assign samples to it.

Library Prep Protocol: Library Prep Validation v2.2.0

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.5 workflow.

Run Library Prep Validation v2.2.0

1. In Lab View, locate the Library Prep Validation v2.2.0 protocol.
   Samples are queued for the Library Prep Validation v2.2.0 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, and drag them to the container wells on the right side.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity (nM). Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

   If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

   a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.

For Research Use Only. Not for use in diagnostic procedures.

b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.

c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
   Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.5 workflow, Define Run Format (NovaSeq 6000 v3.5). This is the only step in Protocol 1: Run Format (NovaSeq 6000 v3.5).

Protocol 1: Run Format (NovaSeq 6000 v3.5)

This protocol includes a single step, Define Run Format (NovaSeq 6000 v3.5). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v3.5)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.5) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.5) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.

- Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.

5. Select Next Steps, which triggers the Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (an empty value not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. Also, a message is recorded in the Warning field for the sample.
     At this point, there are two options:
     - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
     - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step. This is the first step in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step. This is the first step in the NovaSeq Xp protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.5)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run.

For Research Use Only. Not for use in diagnostic procedures.

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5)

1. In Lab View, locate the NovaSeq XP (NovaSeq 6000 v3.5) protocol. Samples for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.5) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
      After exiting from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
- Calculates the Per Sample Volume (µl) value to be added to the pool.
- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, selects the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select on the file to download it and then open it in Excel.

8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.5).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.5).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.5) step.

Step 2: Run Dilute and Denature (NovaSeq 6000 v3.5)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.5) protocol. The pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.5) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}. If it does not, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.

To add and activate reagent lots:

a. In a new browser tab, open an additional instance of Clarity LIMS.
b. Navigate to the Consumables configuration screen.
c. Select the NaOH reagent kit and select New Lot.
d. Enter the lot details.
e. Set the Status of Reagent Lot toggle switch to Active.
f. Select Save.
g. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
h. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 154 Fields Displayed on Record Details Screen of Denature and Dilute (NovaSeq 6000 v3.5)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20

Field	Value
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.

Field	Value
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

   - Select Next Steps.
9. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

10. Select Finish Step.
    After exiting the step, the following actions occur:
    - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

For Research Use Only. Not for use in diagnostic procedures.

At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step. The integration adds samples automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.5)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.5) step.

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.5) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.5) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen, create and name a pool as follows.
   a. Create a pool by dragging samples into the Pool Creator.

      Create only one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

For Research Use Only. Not for use in diagnostic procedures.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

- If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
- Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

7. In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes. This triggers the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (ul) value if % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculate the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:
   - Copies the Flowcell Type values from the step inputs to the step outputs.
   - Sets the next step for samples to ADVANCE, advancing them to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step in the protocol.

   On the Assign Next Steps screen, the next step for samples is set to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step in the workflow.
10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.5)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.5) protocol. The pool of samples queued for the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.5) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.

For Research Use Only. Not for use in diagnostic procedures.

3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (see the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Select Save.
   f. Repeat this process to add and activate the remaining reagent lots.
   g. Return to your original working browser tab and refresh the page.
6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are prepopulated. The script sets the values and they are not editable.
   - In the Sample Details table, select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. The script sets the values and they are not editable.

- The Flowcell Type and Loading Workflow Type columns are populated.
- The working pool number is appended to the bulk pool name, to identify which working pools are derived from the same bulk pool.

7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.5).
9. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.5)

1. On the Ice Bucket screen:
   - In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   - Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag one or more pools from the left of the screen over into the Placed Samples area on the right.
   - Scan or type the barcode of the flow cell into the Flowcell field.
   - Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type (as listed in the following table). This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DRX[XY2357]
S1	[A-Z0-9]{5}DRX[XY2357]
S2	[A-Z0-9]{5}DMX[XY2357]
S4	[A-Z0-9]{5}DSX[XY2357]

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually. For details, refer to the following table:

   Table 155 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.5) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Preset • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index • Custom
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 1 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 1 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Presets • 251* • 151 • 101 • 51 • type a value between 0 and 251 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the UMI in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
Output Folder	Enter network path for sequencing run folder (eg, `\\networkshare\run_data`)
Library Tube Barcode	Scan the library tube barcode.
Samplesheet Format	Presets • V1 • V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet, then select Next Steps to trigger the automation script, which does the following:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

     The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but the various stages can be reviewed in Clarity LIMS (see Review Run Data).

Automations

The NovaSeq Run (NovaSeq 6000 v3.5) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) include a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step. You can use this automation to override the default next step behavior. For details, refer to *NovaSeq 6000 Integration v3.5.0 Configuration and User Interaction* on page 454for details.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen.
  Do not disable or modify this automation to make sure that the Lane Number displays properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate in the master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number*
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version

- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the global fields listed. Values are aggregated across all lanes. Some values (eg, Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000 Integration v3.5.0 Configuration and User Interaction* on page 454.

1. When setting up a run on the NovaSeq 6000 instrument, NVCS sends a request for the run recipe.
    a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step.

b. Clarity LIMS sends a JSON response to NVCS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).

2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates and enables it on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.
4. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends a request only when the run completed successfully, but the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following actions:
   a. Records the metrics into the fields on file placeholder outputs in the LIMS.
   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. For details, refer to *NovaSeq 6000 Integration v3.5.0 Configuration and User Interaction* on page 454.

   > *NovaSeq 6000 Integration v3.5.0 Configuration and User Interaction* on page 454 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq 6000 run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, refer to the following sections in the Clarity LIMS API documentation:

- *Troubleshooting Automated Informatics*
- *Troubleshooting Automation in the API*

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq 6000 Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step, review the log file information. For details, refer to *Logging* on page 533.

If the automated run step starts but does not complete, proceed as follows.

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS, using either the Library Tube, or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If you are unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file. For details, refer to *Logging* on page 533.
3. Contact Illumina Support. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.5) step, the Sequencer API writes a detailed log file to the following location:

`/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`

Log messages include the Library Tube ID and Flowcell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most the log

messages for this request. However, if all messages for downloading a file are found, the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (also included in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)

2021-06-19 21:35:27.158 INFO --- [] FileService : Successfully retrieved file
'NV1234567-LIB.csv' with LIMS ID 40-51 through the API.
```

NovaSeq 6000 Integration v3.5.0 Manual Upgrade

NovaSeq Integration Package v3.5.0 contains modifications to the existing automations from NovaSeq Integration Package v3.4.0.

If you do not want to upgrade the existing NovaSeq Sequencing workflow to the latest version through Illumina Preset Protocols (IPP), you can update the workflow configuration manually by completing the following steps.

Update Validate Flowcell Barcode Automation on Load to Flowcell (NovaSeq 6000 v3.3) Step

Update the Validate Flowcell Barcode automation on the Load to Flowcell (NovaSeq 6000 v3.3) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Flowcell Barcode automation enabled on the Load to Flowcell (NovaSeq 6000 v3.3) step.
3. Update the existing command line with the following script:
   Changes to the existing command line are in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} \
script:evaluateDynamicExpression \
-exp 'if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches(
::[A-Z0-9]{5}DRX[XY2357]:: ) ) {fail ( ::Invalid Flowcell Barcode. Please verify
and try again.:: ) } ; if (input.::Flowcell Type:: == ::S1:: &&
!output.container.name.matches( ::[A-Z0-9]{5}DRX[XY2357]:: ) ) {fail ( ::Invalid
Flowcell Barcode. Please verify and try again.:: ) } ; if (input.::Flowcell
```

```
Type:: == ::S2:: && !output.container.name.matches( ::[A-Z0-9]{5}DMX[XY2357]:: )
) {fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) } ; if
(input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Z0-9]
{5}DSX[XY2357]:: ) ) {fail ( ::Invalid Flowcell Barcode. Please verify and try
again.:: ) } ; output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::' \
-log {compoundOutputFileLuid1}"
```

4. Select Save.

Update Validate Library Tube Barcode Automation on Dilute and Denature (NovaSeq 6000 v3.3) Step

Update the Validate Library Tube Barcode automation on the Dilute and Denature (NovaSeq 6000 v3.3) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Library Tube Barcode automation enabled on the Dilute and Denature (NovaSeq 6000 v3.3) step.
3. Update the existing command line as follows.
   Changes to the existing command line are in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password}
script:evaluateDynamicExpression -exp 'if (!output.container.name.matches( ::[A-
Z]{2}[0-9]{7}-[A-Z]{3}:: ) ) {fail ( ::Invalid Library Tube Barcode. Please
verify and try again.:: ) } ; output.::Flowcell Type:: = input.::Flowcell Type::
; output.::Loading Workflow Type:: = input.::Loading Workflow Type::' -log
{compoundOutputFileLuid1}"
```

4. Select Save.

NovaSeq 6000 Integration v3.5.0 Release Notes

These release notes describe the key changes to software components for the Clarity LIMS NovaSeq 6000 Integration Package.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v5.1 and later
- NGS Extensions Package v5.22 and later
- Illumina Preset Protocols (IPP) v2.4.0 and later
- NovaSeq Control Software (NVCS) v1.8.0
- Illumina bcl2fastq v2.20

New Features

Features provided with this release of the integration package are as follows.

- Fixes the following vulnerabilities:
  - Code injection (CVE-2022-42889)
  - Buffer management errors (CVE-2020-36518, CVE-2022-38752, CVE-2022-38751, CVE-2022-38749)
  - Resource exhaustion (CVE-2022-42003, CVE-2022-42004)
  - Uncontrolled resource consumption (CVE-2022-25857)

Defects Fixed

Fixed the Validate Library Tube and Validate Flowcell Barcode automation scripts to accept only barcodes that are uppercased in the NovaSeq 6000 workflow.

Known Issues

None

NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.4.0 supports the integration of Clarity LIMS to Illumina NovaSeq 6000 instruments. This integration supports Clarity v5.1 and later.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, see *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

> The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows - including renaming protocols, steps, and fields - could break process.

Overview

The integration includes the following features:

- Preconfigured NovaSeq 6000 v3.3 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.3)
  - NovaSeq Standard (NovaSeq 6000 v3.3) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.3) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

- Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file is automatically uploaded to the instrument via the API.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including the following features:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
  - [Optional] Preconfigured Library Prep Validation v2.0.4 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.3 workflow. See the *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596. The Library Prep Validation v2.0.4 workflow is available in IPP v2.3 Package.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.3 workflow as normalized libraries. It is assumed that the following steps have completed before samples are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.4.0 includes the following workflows:

- NovaSeq 6000 v3.3
- Library Prep Validation v2.0.4 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 156 NovaSeq 6000 Integration Package v3.4 Protocols and Steps

Protocol Name	Protocol Purpose	Steps Included in Protocol
	Library Prep Validation v2.0.4 Workflow	
Library Prep Validation v2.0.4	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.3) protocol. The protocol contains a single step - Library Prep Validation v2.0.4. After this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.3 workflow - Define Run Format (NovaSeq 6000 v3.3).	1. Library Prep Validation v2.0.4
	NovaSeq 6000 v3.3 Workflow	
Run Format (NovaSeq 6000 v3.3)	Allows for the assignment of per sample values for: • Loading Workflow Type: Select either NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.3)

For Research Use Only. Not for use in diagnostic procedures.

Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq Standard (NovaSeq 6000 v3.3)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. The run setup information is validated and a sample sheet is generated. Routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) 2. Dilute and Denature (NovaSeq 6000 v3.3)
NovaSeq Xp (NovaSeq 6000 v3.3)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.3) step. The run setup information is validated and a sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) 2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3) 3. Load to Flowcell (NovaSeq 6000 v3.3)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

Validation Workflow

The Library Prep Validation v2.0.4 workflow allows for validation of the system after installation is complete. For details, see *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v3.3 workflow. Automation details are provided in the documentation for each step.

For details on the validation workflow, see *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Table 157 NovaSeq 6000 v3.3 workflow step automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.3)	1. Define Run Format (NovaSeq 6000 v3.3)	Routing Script Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v3.3)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute and Denature (NovaSeq 6000 v3.3)	Routing Script Check Library Tube Barcode Validate Run Setup and Generate Sample Sheet Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.3)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type and Single Pool Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3)	Calculate Volumes Set Next Step Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.3)	Validate Flowcell Barcode Validate Inputs and Selected Container Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)	Update Lane Number Set Next Steps (Not used. By default, this functionality is determined by the Sequencer API. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Terminology

This integration package supports BaseSpace Clarity LIMS v5.1 and later.

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface. However, the API resource is still called UDF.

There are two types of custom fields:

- Master step fields—Configured on master steps. Master step fields only apply to the following:
  - The master step on which the fields are configured.
  - The steps derived from those master steps.
- Global fields—Configured on entities (eg, submitted sample, derived sample, measurement, etc.). Global fields apply to the entire Clarity LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.3)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.3) or the NovaSeq Xp (NovaSeq 6000 v3.3) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.3).

Step 1. Define Run Format (NovaSeq 6000 v3.3)

Step input: NTP (normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares each sample Normalized Molarity value with the Minimum Molarity value. If Normalized Molarity value is lower than the Minimum Molarity value, it sets the samples Loading Workflow Type to [Remove from workflow] and records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
  input.::Warning:: = ::The Normalized Molarity is too low.:: ;
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; }
else { input.::Warning:: = ::not applicable:: }
```

At this point there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.3 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.3 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step.

Default automation command line is as follows:

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
```

```
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.3' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.3' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Master Step Fields

There are four fields defined on the Define Run Format (NovaSeq 6000 v3.3) master step.

The following table lists field configuration details.

Table 158 Define Run Format (NovaSeq 6000 v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Comment	Multiline Text	• Required: No • Read Only: No	None
Flowcell Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: Yes	Presets • SP • S1 • S2 • S4
Instruction	Text	• Required: No • Read Only: Yes	Default • Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Text Dropdown	• Required: Yes • Read Only: No • Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.3) step.

Table 159 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Final Loading Concentration (pM)	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Decimal Places Displayed: 0 Presets • 225 • 400
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Normalized Molarity (nM)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Per Sample Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Warning	Text Dropdown	Required: No Read Only: Yes Custom Entries: Yes	The Normalized Molarity (nM) is too low. Not applicable

User Interaction

Tefer to Run Define Run Format (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.3)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.3)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)

In this step, libraries are placed manually into a single pool. Resuspension buffer and reagents are added.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. This functionality is handled by the core Clarity LIMS configuration for pooling.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes Automation

Automatically triggered when selecting the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30 + 30;
step.::PhiX Volume (ul):: *= 2.2;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (µl):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (µl):: ) / step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value, set at 5, may be edited).
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0}
else {output.::RSB Volume (µl):: = step.::Bulk Pool Volume (µl):: - step.::Total
Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Uses the NovaSeq_Standard_Bulk_Pool1.csv, NovaSeq_Standard_Bulk_Pool2.csv, and NovaSeq_Standard_Bulk_Pool3.csv template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of Dilute and Denature (NovaSeq 6000 v3.3).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
  -o 1.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
  -o 2.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
  -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (ul) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.3):

```
nextStep = ::ADVANCE::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step.

The following table lists configuration details.

Table 160 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric	Required: No Read Only: No	Range = 0–100 Decimal Places Displayed: 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Number of Flowcells to Sequence	Numeric	Required: Yes Read Only: No	Range = 1–10 Decimal Places Displayed: 0
Minimum Per Sample Volume (µl)	Numeric	Required: Yes Read Only: No	Decimal Places Displayed: 2 Default • 5
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 0 Default • 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step.

Table 161 Global Custom Fields Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
RSB Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Step 2: Dilute and Denature (NovaSeq 6000 v3.3)

In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB). Manually place the pooled samples into the library tube for the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

Validate Single Input Automation

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Za-z]{2}[0–9]{7}-[A-Za-z]{3}:

```
if (!output.container.name.matches(::[A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}::)) {
fail(::Invalid Library Tube Barcode. Verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limit.

- If modification is required on Validate Run Setup script, perform the changes directly on the Validation Script custom field default value.
- The script definition portion of the Generate Sample Sheet remains untouched.

Triggered by a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. Refer to *Respond to Validation / Recipe Request Call from Instrument* on page 584 for more details.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
```

```
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is zero, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the values of Read 1 Cycles and Read 2 Cycles are each 151 or less. If the value is greater than 151, an error message is generated.

```
if (input.::Flowc ell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validates UMI Settings.
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.

- If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
- If UMI - Read 1 Length has no value, then UMI - Read 2 Length must not have value.
- If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Validate Analysis Software Version to ensure it is a valid version string.

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
```

```
};
```

- Validate Override Cycles value to only contain Y, N, I, U, 0-9, and semi-colon characters.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. (Refer to *Sample Sheet Generation* on page 582 for more information.) Sample sheet template used depends on the selected value of Samplesheet Format and/or Reverse Complement Workflow.

```
&& if [ '{udf:SampleSheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_V2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeq 6000 v3.3 workflow, and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step.

Default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2}
script:changeWorkflow \
\
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.3' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Master Step Fields

There are 26 fields defined on the Dilute and Denature (NovaSeq 6000 v3.3) step. These fields are required for sample sheet and JSON file generation.

The following table lists field configuration details.

Table 162 Dilute and Denature (NovaSeq 6000 v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text	Required: No Read Only: No	Only applicable for v2 sample sheet. Otherwise, leave this field blank.
BaseSpace Sequence Hub Configuration	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text	Required: No Read Only: No	Not applicable
Experiment Name	Text	Required: Yes Read Only: No	Not applicable

Field Name	Field Type	Options	Additional Options and Dropdown Items
Index Read 1	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Output Folder	Text	Required: Yes Read Only: No	Not applicable
Override Cycles	Text	Required: No Read Only: No	Only applicable for v2 sample sheet. Otherwise, leave this field blank.
Paired End	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • True • False
Read 1 Cycle	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Read 2 Cycle	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 1–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required: Yes Read Only: No	Default • Yes
Run Mode (Not displayed in user interface)	Text Dropdown	Required: No Read Only: Yes Custom Entries: No	Presets • SP • S1 • S2 • S4
Samplesheet Format	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • V1 (default) • V2
Setting Header (not displayed in user interface)	Text	Required: No Read Only: Yes	Not applicable
UMI—Read 1 Length	Numeric	Required: No Read Only: No Custom Entries: Yes	Range = 1
UMI—Read 1 Start From Cycle	Numeric	Required: No Read Only: No Custom Entries: Yes	Range = 1
UMI—Read 2 Length	Numeric	Required: No Read Only: No Custom Entries: Yes	Range = 1

Field Name	Field Type	Options	Additional Options and Dropdown Items
UMI—Read 2 Start From Cycle	Numeric	Required: No Read Only: No Custom Entries: Yes	Range = 1
Use Custom Index Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 2 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Recipe	Toggle Switch	Required: Yes Read Only: No	Default • None Set
Validation Script	Multiline Text	Required: Yes Read Only: Yes	Default value is provided in the drop-down section that follows the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.
Workflow	Text	Required: No Read Only: Yes	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if (step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {

fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } } else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if Paired End is False.::) }; if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined if Paired End is False.::) } }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 2 Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::) }; if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle is greater than 0.::) }; if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail (::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail (::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) { fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) }; step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : :::::; nextStep = ::REMOVE::

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.3) step.

Table 163 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Dilute and Denature (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.3)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.3) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)
- Step 2: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.3)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

Validate Unique Indexes automation is not used. This functionality is handled by the core Clarity LIMS configuration for pooling.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes Automation

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type.

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 22 + 30;
step.::PhiX Volume (ul):: *= 1.9;
};
```

```
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.'Number of Lanes to Sequence' * 30 + 30;
step.::PhiX Volume (ul):: *= 2.2;
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool.

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value set at 5, may be edited).
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value.

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value.

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Bulk_Pool.csv and NovaSeq_Xp_Bulk_Pool2.csv template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the following step - Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3).

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
```

```
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

- Resets the Total Sample Volume (ul) and Number of Samples in Pool field values so that the automation is idempotent.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: - 1;
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: -
input.::Adjusted Per Sample Volume (ul)::
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol.

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are seven fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step.

Table 164 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Additional Options and Dropdown Items
% PhiX (0.25nM) Spike-in	Numeric	Required: No Read Only: No	Range = 0–100
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2

Field Name	Field Type	Options	Additional Additional Options and Dropdown Items
Minimum Per Sample Volume (uL)	Numeric	Required: Yes Read Only: No	Decimal Places Displayed: 2 Default • 5
Number of Lanes to Sequence	Numeric	Required: Yes Read Only: No	Decimal Places Displayed: 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 0 Default • 0
PhiX Volume (ul) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	Required: No Read Only: No	Decimal Places Displayed: 0 Default • 0

Global Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step.

Table 165 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.3)

In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. Manually create working pools based on the number of lanes you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (µl):: = 18 ;
output.::NaOH Volume (µl):: = 4.50 ;
output.::Tris-HCl Volume (µl):: = 4.50 ;
step.::DPX1 Volume (µl):: = 126 ;
step.::DPX2 Volume (µl):: = 18 ;
step.::DPX3 Volume (µl):: = 66 ;
output.::Mastermix per Lane (µl):: = 63
};

if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4.50;
output.::Tris-HCl Volume (µl):: = 4.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5.50;
output.::Tris-HCl Volume (µl):: = 5.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
```

For Research Use Only. Not for use in diagnostic procedures.

```
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7.50;
output.::Tris-HCl Volume (µl):: = 7.50;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs.

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Working_Pool.csv and NovaSeq_Xp_Working_Pool2.csv template files to generate a single CSV file containing information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the following step - Load to Flowcell (NovaSeq 6000 v3.3).

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
-o {compoundOutputFileLuid0}.csv \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
-o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

There are three fields defined on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3) step. These field values are set by a script and are not editable while running the step.

The following table lists field configuration details.

Table 166 Dilute, Denature, and ExAmp (NovaSeq v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0
DPX2 Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0
DPX3 Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0

Global Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3) step.

Table 167 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4

Field Name	Field Type	Options	Additional Options and Dropdown Items
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 0
NaOH Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	Required: No Read Only: Yes	Decimal Places Displayed: 2

User Interaction

Refer to Run Dilute, Denature & ExAmp (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting* on page 596.

Step 3: Load to Flowcell (NovaSeq 6000 v3.3)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeq run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DMX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DSX[XY2357]:: ) ) {
fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: )
};
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; \
```

```
output.::Loading Workflow Type:: = input.::Loading Workflow Type::'
```

Validate Run Setup and Generate Sample Sheet Automation

The script definition portion of Validate Run Setup has been moved into the Validation Script custom field due to the 4000 character limitation.

- If modification is required to the Validate Run Setup script, perform the changes directly on Validation Script custom field default value.
- The script definition portion of Generate Sample Sheet is unchanged.

Automatically triggered by selecting a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, displays an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
```

For Research Use Only. Not for use in diagnostic procedures.

```
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error displays.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
```

For Research Use Only. Not for use in diagnostic procedures.

```
}
```

- Validates UMI Settings:
  - If UMI - Read 1 Length has value, UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

- Validate Analysis Software Version

```
if (step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) {
fail(::Analysis Software Version contains prohibited characters. Allowed
characters are 0-9 and period. It shall start and end with numbers and separated
by single period e.g. 3.8.4::)
};
```

- Checks Override Cycles field value.

```
if (step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) {
fail(::Override Cycles contains prohibited characters. Allowed characters are:
Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::)
};
```

- Outputs the Settings Header in sample sheet if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - AUTOMATED - Run (NovaSeq 6000) v3.3.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. (Refer to *Sample Sheet Generation* on page 582 for more information.) The sample sheet template depends on the selected value for Samplesheet Format and/or Reverse Complete Workflow.

```
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
```

```
-l {compoundOutputFileLuid1}"
```

Master Step Fields

There are 26 fields defined on the Load to Flowcell (NovaSeq 6000 v3.3) step.

The following table lists the field configuration details.

Table 168 Load to Flowcell (NovaSeq 6000 v3.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Analysis Software Version	Text	Required: No Read Only: No	Only applicable for v2 sample sheet. Otherwise, leave this field blank.
BaseSpace Sequence Hub Configuration	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Text	Required: No Read Only: No	Not applicable
Experiment Name	Text	Required: Yes Read Only: No	Not applicable
Index Read 1	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–20 Decimal Places Displayed: 0 Presets • 0 • 6 • 8
Library Tube Barcode	Text	Required: Yes Read Only: No	Not applicable
Output Folder	Text	Required: Yes Read Only: No	Not applicable

Field Name	Field Type	Options	Additional Options and Dropdown Items
Override Cycles	Text	Required: No Read Only: No	Only applicable for v2 sample sheet. Otherwise, leave this field blank.
Paired End	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Read 2 Cycles	Numeric Dropdown	Required: Yes Read Only: No Custom Entries: Yes	Range = 0–251 Decimal Places Displayed: 0 Presets • 251* • 151 • 101 • 51 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Reverse Complement Workflow	Toggle Switch	Required: Yes Read Only: No	Default • Yes
Run Mode (not displayed in user interface)	Text Dropdown	Required: No Read Only: Yes Custom Entries: No	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Samplesheet Format	Text Dropdown	Required: No Read Only: No Custom Entries: No	Presets • V1 (default) • V2
Settings Header (not displayed in user interface)	Text	Required: No Read Only: Yes	Not applicable
UMI—Read 1 Length	Numeric	Required: No Read Only: No Custom Entries: Yes	Range = 1
UMI—Read 1 Start From Cycle	Numeric	Required: No Read only: No Custom Entries: Yes	Range = 1
UMI—Read 2 Length	Numeric	Required: No Read only: No Custom Entries: Yes	Range = 1
UMI—Read 2 Start From Cycle	Numeric	Required: No Read only: No Custom Entries: Yes	Range = 1
Use Custom Index Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 1 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Read 2 Primer	Toggle Switch	Required: No Read Only: No	Default • None Set
Use Custom Recipe	Toggle Switch	Required: Yes Read Only: No	Default • No
Validation Script	Multiline Text	Required: Yes Read Only: Yes	Default value provided in the drop-down section following the table. Do not remove this field as it is used by Validate Run Setup and Generate Sample Sheet automation script.

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Dropdown Items
Workflow	Text	Required: No Read Only: Yes	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • No Index • Single Index • Dual Index • Custom

Validation Script

step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if (step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } } else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if Paired End is False.::) }; if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined if Paired End is False.::) } }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 1 Cycles:: > 151) { fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::) }; if (input.::Flowcell Type:: != ::SP:: && step.::Read 2 Cycles:: > 151) { fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::) }; if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle is greater than 0.::) }; if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail (::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail (::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) { fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::) }; if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) }; step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) || step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : :::::; nextStep = ::ADVANCE::

For Research Use Only. Not for use in diagnostic procedures.

Global Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.3) step.

Table 169 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • SP • S1 • S2 • S4
Loading Workflow Type	Text Dropdown	Required: Yes Read Only: No Custom Entries: No	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

Refer to Run Load to Flowcell (NovaSeq 6000 v3.3) step section in *NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction* on page 536.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

This final protocol contains one fully automated step, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3), described in the following section.

> This is a fully automated step. Do not add samples to the Ice Bucket or start the step manually. The sequencing service does not update samples correctly if they have been manually started.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

Set Next Steps Automation

By default, the Set Next Steps automation is disabled (set to Not Used) and the Sequencer API sets the next step for samples.

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.
3. Disable or configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. For details, see *Configuring Autocomplete Properties* on page 594.

Update Lane Number Automation

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Master Step Fields

The following table lists the run parameters parsed from the RunParameter.xml file and mapped to fields configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step.

Table 170 Run Parameters - Field Mappings

Step UDF / Custom Field Name
Current Cycle
Current Read
Firmware Version
Flow Cell Expiration Date
Flow Cell ID
Flow Cell Lot Number
Flow Cell Mode
Flow Cell Part Number
Flow Cell Side
Instrument Control Software Version
Instrument ID
Instrument Type
Lane Counter
Loading Workflow Type

Step UDF / Custom Field Name
Output Folder
RTA Version
Run Completion Date
Run ID
Run Status
Sequencing Log

Global Fields

The following global custom fields are used to capture the run metrics in Clarity LIMS.

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following details:

- Values are aggregated across all lanes. Some values, for example Yield PF (Gb) R1, are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeq Integration v3.4.0 configuration provided in the Illumina Preset Protocols (IPP) v2.3 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If field names are changed in Clarity LIMS, they must also be changed through the run.metricUdfNames properties file in the application.yml file for the Sequencer API (see *application.yml Properties* on page 589. All fields are configured to be visible on the Record Details screen for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step (in the Sample Details table).

These global custom fields are configured on the Container entity, visible on each input, but they should not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are currently no per-lane metrics provided by NovaSeq Control Software.

Sample Sheet Generation

The sample sheet is generated on the step before the run, which is Dilute and Denature (NovaSeq 6000 v3.3) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.3) in the NovaSeq Xp protocol. This step places samples on the library tube or flow cell that are loaded in the NovaSeq instrument.

In the default configuration, the Validate Run Setup and Generate Sample Sheet automation generates one CSV format sample sheet file for use with bcl2fastq v2.20 downstream analysis.

The sample sheet is uploaded to the NVCS via the /Illumina/Sequencer/v2/sequencing-run/files endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from the Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Content

The sample sheet content is controlled by the following step UDFs/custom fields that display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow

- Reverse Complement Workflow
- Samplesheet Format

  Depending on Samplesheet Format field value selection, a v1 or v2 sample sheet is generated.

  See the Bcl2fastq2 Sample Sheet Generation section of *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542 for detailed information on the following items:
- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at /Illumina/Sequencer/v2/sequencing-run/login). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen to the user. Log in to automatically authorize the NVCS to use your account to access the Clarity LIMS.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact the Clarity LIMS at http://localhost:9080/clarity/. This URL is set by the installation script, but it can be configured with the clarity.url property in the application.yml file (see *application.yml Properties* on page 589
3. The user is redirected to the Sequencer login page at /Illumina/Sequencer/v2/sequencer_login.
   - If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to /Illumina/Sequencer/v2/sequencer_login/Success. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
   - If authentication fails, the user is left on the login screen and a warning message informs them of the failure. A background redirect to /Illumina/Sequencer/v2/sequencer_login/Error informs the NovaSeq of the failure.

Respond to Validation / Recipe Request Call from Instrument

1. The sequencing-run/recipe/novaseq endpoint consumes a POST request with a LibraryContainerI, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagent information is provided by the NovaSeq.
   - LibraryContainerId and FlowCellId should match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the application.yml file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. See *application.yml Properties* on page 589 for more details.
3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API and the run recipe is generated.
   Note the following details:
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.3) or Load to Flowcell (NovaSeq 6000 v3.3) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.4.0 configuration included in IPP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe and the value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
   - The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the application.yml (see *application.yml Properties* on page 589 for more details). If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

For Research Use Only. Not for use in diagnostic procedures.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The contents of the run recipe are controlled by the sample sheet contents and the fields configured on the Dilute and Denature (NovaSeq 6000 v3.3) and Load to Flowcell (NovaSeq 6000 v3.3) steps:

Example of run recipe content is as follows:

```
{
  "run_name": "NVCS16027_SPrime_2x250",
  "run_mode": "S4",
  "workflow_type": "DualIndex",
  "librarytube_id": "NV0025867-LIB",
  "flowcell_id": "",
  "sample_loading_type": "NovaSeqStandard",
  "rehyb": false,
  "paired_end": true,
  "read1": 151,
  "read2": 151,
  "index_read1": 8,
  "index_read2": 8,
  "output_folder": "\\\\network_path\\run_data",
  "samplesheet": "<path to sample sheet on LIMS server>",
  "require_samplesheet_authentication": true,
  "usecustomrecipe": false,
  "customRecipe": null,
  "use_basespace": false,
  "basespace_mode": null,
  "use_custom_read1_primer": false,
  "use_custom_read2_primer": false,
  "use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   If no matching container is found or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged and the step cannot be completed by the API without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored and a warning is logged during lot tracking.
3. The number of replicates for the step is determined by the type of flow cell being used in the run.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged and the reagent is ignored.
   - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and step 2.
   - Name—Serial number in request.
   - Lot Number—Lot number in request.
   - Expiry—Expiry date in request.
   - Status—Active.

   If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.

For Research Use Only. Not for use in diagnostic procedures.

6. Master step custom fields are updated with the run information parsed from the request. See *Respond to Record InterOps Metrics Call from Instrument* on page 587.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). See *Respond to Record InterOps Metrics Call from Instrument* on page 587.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Find the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, the Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master step custom fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the sequencing run is ended by the user, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status master fields are updated.
2. The multiline Sequencing Log master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed

The following sections describe the various components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration.

Illumina NovaSeq Integration v3.4.0 is distributed as an RPM package, BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- Configuration file - application.yml
- Two configuration scripts: configure_sequencer_api_proxy.sh and configure_sequencer_api_application.sh

The NovaSeq v3 configuration is delivered through the Illumina Preset Protocols (IPP) v2.3 which requires installation of the NGS Extensions Package v5.21.0 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.21.0 is installed, the latest version is installed by default with the NovaSeq integration. See *Release Notes* for details.
- If NGS Extensions Package v5.21.0 or later is already installed, upgrade is not forced or required.

NovaSeq 6000 Integration RPM Components

The following table lists the components installed by the RPM package.

Files Installed	Location and Description
Illumina#Sequencer#v2.war	/opt/gls/clarity/tomcat/current/webapps War file for NovaSeq v3.4.0 API.

Files Installed	Location and Description
configure_sequencer_api_application.sh	/opt/gls/clarity/config/ Script that configures the Sequencer API application through its external application.yml file.
configure_sequencer_api_env.sh	/opt/gls/clarity/config/ Script that configures the Clarity LIMSTomcat configuration to include Secret Util settings.
configure_sequencer_api_proxy.sh	/opt/gls/clarity/config/ Script that configures the proxy to allow communication with the Sequencer API (NovaSeq v3.4.0 API) application.
sequencer-api.conf	/etc/httpd/clarity/ Proxy setting to communicate with the Clarity LIMS.

application.yml Properties

The application.yml file is located at opt/gls/clarity/extensions/sequencing-api/.

- All properties are configured automatically during installation, but they can also be configured by editing the application.yml file and then restarting Tomcat.
- All custom field names, both for recipe and run information, are represented by properties in the file.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, the Loading Workflow Type can be changed, but recipe.udfNames.sampleLoadingType cannot.

Table 171 application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (configure_ sequencer_api_application) prompts for this.
clarity.username	Username to be used when communicating with Clarity LIMS.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
security.signing-key	Private key that should be used when signing/validating OAuth tokens. Changing this invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration may find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line should be indented to the same point and start with a dash (-). Default value: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

novaseq.flowcells	List of supported NovaSeq flow cell types.
	• Type names exactly match the values used by the NVCS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default value:
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4`
	`"lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description

novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps.
	- lotName: The name of the lot as it appears in the run started request.
	- kitName: The name of the corresponding reagent kit in Clarity LIMS that the lot should be tracked as.
	• The name may differ in the NVCS request vs. the Clarity LIMS configuration.
	Default value:
	`- lotName: "Buffer"kitName: "Buffer Cartridge"`
	`- lotName: "Cluster"kitName: "Cluster Cartridge"`
	`- lotName: "SBS"kitName: "SBS Cartridge"`

recipe.udfNames	Configures the names of the fields used in the run recipe. See Run Recipe Contents section in *NovaSeq Run* on page 583 for more information). • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.stepUdfNames	Configures the step UDF/master step field names to be used when recording run results. (See Master Step Fields section in *NovaSeq Run* on page 583 for more information.) • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.
run.metricUdfNames	Configures the result file UDFs/measurement global field names to be used when recording run results. These are the fields that capture the run data. (See *Global UDFs* section for more information.)
run.autoComplete	Determines whether the sequencing run step should be completed automatically after parsing the run metrics on a run (see also run.autoCompleteOnlyAtSuccess). Default value: true See the *Configuring Autocomplete Properties* on page 594 section for more information.
run.autoCompleteOnlyAtSuccess	Determines which of the following options the sequencing run step should be: • Autocompleted when the run status is RunCompletedSuccessfully (if autoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true See the *Configuring Autocomplete Properties* on page 594 section for more information.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

This integration supports the following items:

- Library tube with barcode provided in the format [A-Za-z]{2}[0–9]{7}-[A-Za-z]{3}
  Example: AB1234567-XYZ
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Za-z0-9]{5}DRX[XY2357]
  - S2 flow cell: [A-Za-z0-9]{5}DMX[XY2357]
  - S4 flow cell: [A-Za-z0-9]{5}DSX[XY2357]

  Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

1. On the steps that use the routing script - Define Run Format (NovaSeq 6000 v3.3) and Dilute and Denature (NovaSeq 6000 v3.3) - the Next Step for all samples must be set to Remove from workflow. This value is set by a script. The value must not change in the Assign Next Steps screen.
2. In the protocol configuration screen, the following settings are required and must not be changed: In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.

Configuring Autocomplete Properties

As of NovaSeq Integration v3.4.0, the application.yml configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3), is automatically completed:

- Only when the run status is "RunCompletedSuccessfully" (default behavior)

  -or-

- Regardless of the run status

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

For the step to autocomplete regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the application.yml file located at /opt/gls/clarity/extensions/sequencer-api/application.yml:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.
3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autocomplete behavior of the sequencing step.

Table 172 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true (default)	true (default)	• Step autocompletes only if sequencing run is successful. • If run is not successful, step does not autocomplete and run details are recorded in Clarity LIMS.
true	false	• Step autocompletes, regardless of the run status.
false	true	• Step does not autocomplete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* section in *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542.
- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3 step. This step is a fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, the Validate Run Setup and Generate Sample Sheet button must be selected.

NovaSeq 6000 Integration v3.4.0 Validation and Troubleshooting

This section explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.4.0.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.3 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.3) step to the NovaSeq Standard (NovaSeq 6000 v3.3) or NovaSeq Xp (NovaSeq 6000 v3.3) step.
  - Automated generation of v1 sample sheet for use with bcl2fastq2 v2.20 analysis software or v2 sample sheet. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume that the Illumina NovaSeq 6000 Integration Package v3.4.0 is installed and you have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000 v3.3 workflows.

1. On the Configuration tab, under Workflows, activate both the Library Prep Validation and NovaSeq 6000 v3.3 workflows.
   - For Clarity LIMS v5.1 and later, Library Prep Validation v2.0.4 can be imported from Clarity LIMS v5.0 with IPP v2.3 installed.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v2.0.4

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.3 workflow.

Run Library Prep Validation v2.0.4

1. In Lab View, locate the Library Prep Validation v2.0.4 protocol.
   Samples are queued for the Library Prep Validation v2.0.1 4 step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, and drag them to the container wells on the right side.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.
   a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen, complete the following actions:
   a. In the Sample Details table, enter values for Normalized Molarity. Type values individually or copy and paste to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate all fields at one time, copy and paste from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

   If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

   a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.
   b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
   c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

For Research Use Only. Not for use in diagnostic procedures.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
   Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.3 workflow, Define Run Format (NovaSeq 6000 v3.3). This is the only step in Protocol 1: Run Format (NovaSeq 6000 v3.3).

Protocol 1: Run Format (NovaSeq 6000 v3.3)

This protocol includes a single step, Define Run Format (NovaSeq 6000 v3.3). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v3.3)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.3) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.3) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.
   - Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.
5. Select Next Steps, which triggers the Next Steps automation and the following actions:

- Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
- Calculates the Minimum Molarity.
- Checks Normalized Molarity value. For samples with no Normalized Molarity value (in other words, empty value, not including 0), generates an error message notifying that the field cannot be empty.
- Compares each sample Normalized Molarity value with the Minimum Molarity value.

6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. Also, a message is recorded in the Warning field for the sample.
     At this point, there are two options:
     - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
     - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step. This is the first step in the NovaSeq Standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step. This is the first step in the NovaSeq Xp protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.3)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)
2. Dilute and Denature (NovaSeq 6000 v3.3)

For Research Use Only. Not for use in diagnostic procedures.

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3)

1. In Lab View, locate the NovaSeq XP (NovaSeq 6000 v3.3) protocol. Samples for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.3) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
      After exiting from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation. This automation performs calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
- Calculates the Per Sample Volume (µl) value to be added to the pool.
- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, selects the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select on the file to download it and then open it in Excel.

8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.3).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.3).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.3) step.

Step 2: Run Dilute and Denature (NovaSeq 6000 v3.3)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.3) protocol. The pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.3) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}. If it does not, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.

For Research Use Only. Not for use in diagnostic procedures.

To add and activate reagent lots:

a. In a new browser tab, open an additional instance of Clarity LIMS.
b. Navigate to the Consumables configuration screen.
c. Select the NaOH reagent kit and select New Lot.
d. Enter the lot details and select Save.
e. Set the Status of Reagent Lot toggle switch to Active.
f. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
g. Return to your original working browser tab and refresh the page.

6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 173 Fields Displayed on Record Details Screen of Denature and Dilute (NovaSeq 6000 v3.3)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.
Workflow	Automatically populated with the preset GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8, or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8, or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51, or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51, or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.

Field	Value
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Samplesheet Format	Select from preset options: V1 or V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which performs the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with those sections.

   - Select Next Steps.

9. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

10. Select Finish Step.
    After exiting the step, the following actions occur:
    - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step.

    At this point in the workflow, the user interaction ends. Proceed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3).

    Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step. The integration adds samples automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.3)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.3) step.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)
2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3)
3. Load to Flowcell (NovaSeq 6000 v3.3)

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.3) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.3) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Create only one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.

For Research Use Only. Not for use in diagnostic procedures.

5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

     Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
     - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
     - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
7. In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes. This triggers the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (ul) value if % PhiX (0.25nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculate the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.
9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:
   - Copies the Flowcell Type values from the step inputs to the step outputs.

For Research Use Only. Not for use in diagnostic procedures.

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3).

On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3).

10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.3)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.3) protocol. The pool of samples queued for the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.3) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (see the next step).
5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details and select Save.

For Research Use Only. Not for use in diagnostic procedures.

d. Set the Status of Reagent Lot toggle switch to Active.
e. Repeat this process to add and activate the remaining reagent lots.
f. Return to your original working browser tab and refresh the page.

6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are prepopulated. The script sets the values and they are not editable.
   - In the Sample Details table, select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. The script sets the values and they are not editable.
     - The Flowcell Type and Loading Workflow Type columns are populated.
     - The working pool number is appended to the bulk pool name, to identify which working pools are derived from the same bulk pool.
7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.3).
9. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.3)

1. On the Ice Bucket screen:
   - In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   - Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag one or more pools from the left of the screen over into the Placed Samples area on the right.

For Research Use Only. Not for use in diagnostic procedures.

- Scan or type the barcode of the flow cell into the Flowcell field.
- Select Record Details.

After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type (as listed in the following table). This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flowcell Type	Barcode Mask
SP	[A-Za-z0-9]{5}DRX[XY2357]
S1	[A-Za-z0-9]{5}DRX[XY2357]
S2	[A-Za-z0-9]{5}DMX[XY2357]
S4	[A-Za-z0-9]{5}DSX[XY2357]

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
Some of these fields are autopopulated and some must be entered manually (see the following table for details).

Table 174 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.3) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Library Tube Barcode	Scan the library tube barcode.
Samplesheet Format	Select from preset options: V1 or V2
Analysis Software Version	Enter the software version for BCL Convert Analysis for v2 sample sheet. Leave blank if not applicable.
Override Cycles	Enter the Override Cycles value for v2 sample sheet. Leave blank if not applicable.

5. Select Validate Run Setup and Generate Sample Sheet, then select Next Steps to trigger the automation script, which:
   - Validates the parameters entered on the Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

- Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.

The v2 sample sheet generated does not include Cloud and Analysis sections. Contact Illumina Support for information on generating v2 sample sheets with these sections.

6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step.

Proceed to AUTOMATED - .NovaSeq Run (NovaSeq 6000 v3.3).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but the various stages can be reviewed in Clarity LIMS (see Review Run Data).

Automations

The NovaSeq Run (NovaSeq 6000 v3.3) step contains two automations:

- Set Next Steps—This automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
  The Illumina Preset Protocols (IPP) include a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step. You can use this automation to override the default next step behavior. See *NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction* on page 536for details.
- Update Lane Number—This automation is triggered automatically upon entry to the Record Details screen.
  Do not disable or modify this automation to make sure that the Lane Number displays properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate in the step UDFs/master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number*
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the UDFs/global fields listed. Values are aggregated across all lanes. Some values (for example Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2*
- Reads PF (M) R1*
- Reads PF (M) R2*
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

How the Integration Works

The following steps summarize how the Sequencer API integration works. For details on sample sheet generation and the sequence of events involved in the NovaSeq run, refer to *NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction* on page 536.

1. When setting up a run on the NovaSeq instrument, NVCS sends a request for the run recipe.
   a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3 step.
   b. Clarity LIMS sends a JSON response to NVCS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).
2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates and enables it on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.
   b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).
3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully

- RunEndedByUSer
- RunErroredOut

The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.

4. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends a request only when the run completed successfully, but the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following:
   a. Records the metrics into the fields on file placeholder outputs in the LIMS.
   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. Refer to *NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction* on page 536 for details.

   > *NovaSeq 6000 Integration v3.4.0 Configuration and User Interaction* on page 536 provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, see the following sections in the Clarity LIMS API documentation:

- Troubleshooting Automated Informatics
- Troubleshooting Automation in the API

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step, review the log file information. For details, refer to *Logging* on page 614.

If the automated run step starts, but does not complete:

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.

- Search for the step in Clarity LIMS, using either the Library Tube, or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeq Standard or NovaSeq Xp run.

2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the sequencer-api.log file. For details, refer to *Logging* on page 614.
3. Contact the Clarity LIMS support team. Provide the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.3) step, the Sequencer API writes a detailed log file to /opt/gls/clarity/tomcat/current/logs/sequencer-api.log.

Log messages include the Library Tube ID and Flowcell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for Xp). The relevant container name search finds most the log messages for this request. However, if all messages for downloading a file are found, then the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (which can also be found in the log file).

Example lines from the log file:

```
2021-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started

```

NovaSeq 6000 Integration v3.4.0 Manual Upgrade

NovaSeq Integration Package v3.4.0 supports future ICA services along with NovaSeq Control Software v1.8 (with the ICA integration feature). As a result, there are new custom fields and a new sample sheet template file. There are also modifications to the existing automations and step configurations.

If you do not want to upgrade the existing NovaSeq Sequencing v3.2 workflow to the latest version through Illumina Preset Protocols (IPP), you can update the workflow configuration manually by completing the following steps.

Create a Custom Field

1. In Clarity LIMS, under Configuration, select the Custom Fields tab.
2. Under the Global Fields tab, select Submitted Sample.
3. Create a custom field named Illumina Universal Sample Identifier.
4. For Field Type, select Text.
5. For Field Options, select the following:
    - Required Field—No
    - Read Only—No
6. Select Save.

Modify the Existing NovaSeq v3.2 Workflow

Create custom fields for master steps in the workflow as follows.

1. From Configuration, select the Custom Fields tab.
2. Under the Master Step Fields tab, select the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.2) master step.
3. Create a custom field named Run Completion Date.
4. For Field Type, select Text.
5. For Field Options, select the following:
    - Required Field—No
    - Read Only—Yes
6. Under the Master Step Fields tab, select the Dilute and Denature (NovaSeq 6000 v3.2) master step.
7. Create custom fields using the following table.

Table 175 Custom Fields for Dilute and Denature (NovaSeq 6000 v3.2) Master Step

Name	Field Type	Field Options	Additional Options
Analysis Software Version	Text	• Required—No • Read Only—No	Not applicable
Override Cycles	Text	• Required—No • Read Only—No	Not applicable

Name	Field Type	Field Options	Additional Options
Samplesheet Format	Text Dropdown	• Required—Yes • Read Only—No • Custom Entries—No	• Dropdown Items—V1, V2 • For V1, select Yes under Set as Default
Validation Script	Multiline Text	• Required—Yes • Read Only—Yes	Default value provided in the drop-down section following the table.

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail
(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::) } } else { if (step.::Index Read 1:: == 0 || step.::Index
Read 2:: == 0) { fail(::Index Read 1 and Index Read 2 must be greater than 0 if
Dual Index is selected.::) } }; if (step.::Paired End::.toBoolean()) { if
(step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) { fail(::Read 1
Cycles and Read 2 Cycles must be greater than 0 if Paired End is True.::) } }
else { if (step.::Read 2 Cycles:: != 0) { fail(::Read 2 Cycles must be 0 if
Paired End is False.::) }; if (step.hasValue(::UMI - Read 2 Length::) ||
step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 2 Length
and UMI - Read 2 Start From Cycle cannot be defined if Paired End is False.::) }
}; if (input.::Flowcell Type:: != ::SP:: && step.::Read 1 Cycles:: > 151) { fail
(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::) };
if (input.::Flowcell Type:: != ::SP:: && step.::Read 2 Cycles:: > 151) { fail
(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::) };
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than
0 if UMI - Read 1 Length is greater than 0.::) }; if (!step.hasValue(::UMI -
Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail
(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle
is greater than 0.::) }; if (step.hasValue(::UMI - Read 2 Length::) &&
!step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 2 Start
From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
}; if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) { fail(::UMI - Read 2 Length must be greater than 0 if UMI
```

For Research Use Only. Not for use in diagnostic procedures.

```
- Read 2 Start From Cycle is greater than 0.::) }; if (!step.hasValue(::UMI -
Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) { fail(::UMI - Read
1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::) };
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be
greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) }; if
(step.hasValue(::Analysis Software Version::) && !step.::Analysis Software
Version::.matches(::^(\\d+)(\\.\\d+)*$::)) { fail(::Analysis Software Version
contains prohibited characters. Allowed characters are 0-9 and period. It shall
start and end with numbers and separated by single period e.g. 3.8.4::) }; if
(step.hasValue(::Override Cycles::) && !step.::Override Cycles::.matches(::
[YNIU0-9;]+::)) { fail(::Override Cycles contains prohibited characters. Allowed
characters are: Y, N, I, U, 0-9 and ;. Example: N1Y150;I8;I7N1;Y141U10.::) };
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep =
::REMOVE::
```

8. Select Save.
9. Under the Master Step Fields tab, select the Load to Flowcell (NovaSeq 6000 v3.2) master step.
10. Create custom fields using the following table.

Table 176 Custom Fields for Load to Flowcell (NovaSeq 6000 v3.2) Master Step

Name	Field Type	Field Options	Additional Options
Analysis Software Version	Text	• Required—No • Read Only—No	Not applicable
Override Cycles	Text	• Required—No • Read Only—No	Not applicable
Samplesheet Format	Text Dropdown	• Required—Yes • Read Only—No • Custom Entries—No	• Dropdown Items—V1, V2 • For V1, select Yes under Set as Default
Validation Script	Multiline Text	• Required—Yes • Read Only—Yes	Default value provided in the drop-down section following the table.

Validation Script

```
step.::Run Mode:: = input.::Flowcell Type::; if (!step.::Experiment
Name::.matches(::[a-zA-Z0-9-_]+::)) { fail(::Experiment Name contains prohibited
characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) }; if
(step.::Workflow Type:: == ::No Index::) { if (step.::Index Read 1:: != 0 ||
```

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Index Read 2:: != 0) { fail(::Index Read 1 and Index Read 2 must be 0 if
No Index is selected.::) } } else if (step.::Workflow Type:: == ::Single
Index::) { if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) { fail

```

For Research Use Only. Not for use in diagnostic procedures.

```
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::; nextStep =
::ADVANCE::
```

11. Select Save.

Update Step File Placeholder

1. From Configuration, select the Lab Work tab.
2. In the Master Steps list, select the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.2) master step.
3. Select the Record Details milestone.
4. In Step File Placeholders, create a Log File.
5. In the Master Steps list, select the Define Run Format (NovaSeq 6000 v3.2) step.
6. Select the Record Details milestone.
7. In Step File Placeholders, change the first placeholder name to Log File.
8. In the Master Steps list, select the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.2) master step.
9. Select the Record Details milestone.
10. In Step File Placeholders, change the second placeholder name to Log File.
11. In the Master Steps list, select the Make Bulk Pool for NovaSeq XP (NovaSeq 6000 v3.2) master step.
12. Select the Record Details milestone.
13. In Step File Placeholders, change the second placeholder name to Log File.

Modify Existing Automations

Update the Lane Number automation on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.2) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Update Lane Number automation enabled on the Under the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.2) step.
3. Change `compoundOutputFileLuid3` to `compoundOutputFileLuid0` in the existing command line as follows.
   Changes to the existing command line are in red.

```
bash -l -c "sleep 10 && /opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -i {stepURI:v2}
-u {username} -p {password} \
script:evaluateDynamicExpression \
```

```
-exp 'if (input.::Loading Workflow Type:: == ::NovaSeq Standard::) {
output.::name:: = ::Lane :: + step.::Lane Counter::; output.::name:: =
output.::name::.split(::\\.::)[0] + :::1::; step.::Lane Counter::++; }' \
-log {compoundOutputFileLuid0} \
-t true \
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} \
script:evaluateDynamicExpression \
-exp 'step.::Lane Counter:: = 1' \
-log {compoundOutputFileLuid0} \
-t true"
```

4. Select Save.

Update the Validate Run Setup and Generate Sample Sheet automation on the Dilute and Denature (NovaSeq 6000 v3.2) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Run Setup and Generate Sample Sheet automation enabled on the Dilute and Denature (NovaSeq 6000 v3.2) step.
3. Update the existing command line as follows.
   Changes to the existing command line are in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} \
script:evaluateDynamicExpression \
-exp '{udf:Validation Script}' \
-log {compoundOutputFileLuid1} \
-t true \
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \

common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
```

For Research Use Only. Not for use in diagnostic procedures.

```
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

4. Select Save.

Update the Validate Run Setup and Generate Sample Sheet automation on the Load to Flowcell (NovaSeq 6000 v3.2) step as follows.

1. From Configuration, select the Automation tab.
2. Under the Step Automation tab, select the Validate Run Setup and Generate Sample Sheet automation enabled on the Under the Load to Flowcell (NovaSeq 6000 v3.2) step.
3. Update the existing command line as follows.
   Changes to the existing command line are in red.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -i {stepURI:v2} -u {username} -p {password} \
script:evaluateDynamicExpression \
-exp '{udf:Validation Script}' \
-log {compoundOutputFileLuid1} \
-t true \
&& if [ '{udf:Samplesheet Format}' == 'V2' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet_v2.csv'; \

-l {compoundOutputFileLuid1}"
```

4. Select Save.

Add New v2 Sample Sheet Template File

To add the new sample sheet template file, download `NovaSeq_BCL2FASTQ_Samplesheet_v2.csv` and place the file in the following location:

`/opt/gls/clarity/extensions/conf/driverfiletemplates`

Modify Step to Display New Custom Fields

1. From Configuration, select the Lab Work tab.
2. In the Master Steps list, select the Denature and Dilute (NovaSeq 6000 v3.2) master step.
3. Select the Record Details milestone.
4. In Master Step Fields, add the new custom fields.
   - Analysis Software Version
   - Override Cycles
   - Samplesheet Format
5. Select the check box and save the step.
6. Repeat steps 1 - 5 for the Load to Flowcell (NovaSeq 6000 v3.2) step.

NovaSeq 6000 Integration v3.4.0 Release Notes

These Release Notes describe the key changes to software components for the Clarity LIMS NovaSeq 6000 Integration Package since version 3.3.

This is an optional software update for customers interested in the features available with this release.

If upgrading from a version prior to version 3.3, review the release notes for v3.3 for a list of features and bug fixes introduced in that version.

Compatibility

This version of the integration package is compatible with the following software:

- Clarity LIMS v5.1 and later
- NGS Extensions Package v5.21 and later
- Illumina Preset Protocols (IPP) v2.3.0 and later
- NovaSeq Control Software (NVCS) v1.8.0
- Illumina bcl2fastq v2.20

New Features

Features provided with this release of the integration package are as follows.

- Support for Clarity LIMS v6.0. Clarity LIMS v4.x and v5.0 are not supported.
- Support for NVCS v1.8.0 and v2 sample sheets.
- Updated NovaSeq 6000 v3.3 workflow installed from IPP v2.3.0.

- Tech refresh to upgrade third party libraries.
- Fixes to address the following Apache log4j vulnerabilities:
  - CVE-2021-44228
  - CVE-2021-45046
  - CVE-2021-45105
  - CVE-2021-44832
- Security fixes.

Defect Repairs

N/A

Known Issues

Blocker alert: When an artifact is removed and queued to another workflow, the "Queued" workflow-stage of the artifact is missing on the API level. Consequently, the recipe request of a NovaSeq run fails due to the missing "Queued" stage.

This issue only affects Clarity LIMS v5.2.1. The issue will be fixed in the upcoming Clarity LIMS v5.2.2 release.

NovaSeq 6000 Integration v3.4.0 Sample Sheet Customization

Clarity LIMS NovaSeq 6000 v3.4 Integration Package, together with Illumina Preset Protocols v2.3, provides sample sheet v2 generation functionality. This new functionality allows for ICA support.

The default configuration generates a sample sheet that contains content used for sequencing and BCL Convert. You can also generate v2 sample sheets that include custom content by editing the `NovaSeq_BCL2FASTQ_Samplesheet_v2.csv` template (included with IPP v2.3 and the NovaSeq 6000 v3.3 workflow). For example, custom content might include settings and data for other analysis applications, or additional settings used for BCL conversion.

Depending on the information required by the analysis software, you might need to include additional sample data tables in the generated sample sheet. If you need help determining the content to include in a sample sheet file, consult with the Illumina Support team.

Complete the following steps to create a customized v2 sample sheet template:

1. Create a custom sample sheet template file by editing the default template settings.
2. Create a custom sample sheet template file for analysis.
3. Upload the custom template file to Clarity LIMS.
4. Modify the automation to generate a sample sheet using the custom template file.

For information on troubleshooting the template file and its associated automation, refer to *Troubleshooting Template File Generator* on page 2485.

Edit Default Template File Settings

In this example, two additional settings (AdapterRead1 and AdapterRead2), with predefined values, are added to the BCLConvert_Settings section of the `NovaSeq_BCL2FASTQ_Samplesheet_v2.csv` template file.

Additionally, the settings are configured to retrieve values from the Software Version and Override Cycles master step fields.

After editing, the BLConvert_Settings section appears as follows.

```
[BCLConvert_Settings]
SoftwareVersion,${PROCESS.UDF.Analysis Software Version##Value}
OverrideCycles,${PROCESS.UDF.Override Cycles##Value}
AdapterRead1,CTGTCTCTTATACACATCT
AdapterRead2,GCTAGCTAGCTAGCAGCTT
```

Naming the Output File

The following line in the default template tells the driver_file_generator script to use the OUTPUT.CONTAINER.NAME format for the name of the output file:

```
OUTPUT.FILE.NAME,${OUTPUT.CONTAINER.NAME}.csv
```

As the automation does not have the context for this name value, remove this line from the file and use the driver_file_generator -o option to set the output file name. For more information and an example of -o option usage, refer to the Modify Automation Script to Generate a Custom Sample Sheet section.

Naming the Template File

After editing the default template, save it with a new file name (eg, `NovaSeq_BCL2FASTQ_Samplesheet_v2-modified.csv`).

The example template file is shown in the following drop-down section.

Modified Template Example

```
SORT.BY.${INPUT.CONTAINER.ROW}${INPUT.CONTAINER.COLUMN}
PROCESS.POOLED.ARTIFACTS
CONTROL.SAMPLE.DEFAULT.PROJECT.NAME,Controls
HIDE, ${PROCESS.UDF.Read 2 Cycles##Value}, IF, NODATA

${PROCESS.UDF.Override Cycles##Value}
if (token == '0') {
return null
}
return token
```

For Research Use Only. Not for use in diagnostic procedures.

```
</TOKEN_FORMAT>
```

Create Custom Template File for Analysis

When using a template file for analysis, the file must include a Sample data section containing HEADER and DATA blocks. For information on creating HEADER and DATA blocks, refer to *Creating Template Files* on page 2454.

Each template file can have only one Sample data section containing these blocks. If more Sample data tables are needed, create multiple template files and merge them using the concatenation command (`cat`) in the automation script. An example script that uses this command is provided in the Modify Automation Script to Generate a Custom Sample Sheet section.

Following is an example of a template file that includes HEADER and DATA blocks. The two empty lines after `<HEADER_BLOCK>` provide proper spacing when merging multiple files.

```
<HEADER_BLOCK>

[DragenGermline_Settings]
SoftwareVersion,3.8.4
ReferenceGenomeDir,${PROCESS.UDF.Reference Genome Directory}
MapAlignOutFormat,true
KeepFastq,true

[DragenGermline_Data]
</HEADER_BLOCK>

<HEADER>
Sample_ID
</HEADER>

<DATA>
${SAMPLE.NAME##NoSpecialCharacters}
</DATA>
```

- The [DragenGermline_Settings] section provides ICA with information about the analysis application. It tells ICA that this section belongs to the Dragen Germline Analysis Application and allows for the extraction of the settings information required by the analysis run.
- The sample DATA section provides ICA with information about the analysis application. It tells ICA that this section belongs to the Dragen Germline Analysis Application, and allows for the extraction of the sample data required by the analysis run.

Upload Custom Template File

1. From Configuration, select the Automation tab.
2. From the Automation tab, select the Step Automation tab.
3. In the automations list, select the automation to modify.
4. Under Template Files, select Upload File and upload the custom template file.

After uploading the template file, a new token for the file displays in the Tokens section. You can use this token in the automation command line, as described in the following section.

Modify the Automation to Generate a Custom Sample Sheet

After uploading a template file, modify the automation so that the driver_file_generator script uses the new file to generate the sample sheet. Following is an example of a modified automation command line.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} \
script:driver_file_generator \
-t {file:NovaSeq_BCL2FASTQ_Samplesheet_v2-modified.csv} \
-o 1.csv \
script:driver_file_generator \
-t {file:Custom_DrageGermline.csv} \
-o 2.csv \
&& cat 1.csv 2.csv > {compoundOutputFileLuid0}.csv"
```

In this example, the last line uses concatenation to merge the two files referenced in the script (eg, `NovaSeq_BCL2FASTQ_Samplesheet_v2-modified.csv` and `Custom_DrageGermline.csv`) into a single file.

NovaSeq 6000 Integration v3.3.0 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.3.0 supports the integration of Clarity LIMS to Illumina NovaSeq 6000 instruments.

Note the following key changes for this version of the integration:

- Support for Secret Management mechanism
- A workflow as part of the Preconfigured Workflows Package (PCWP) v2.0.1 and Illumina Preset Protocol (IPP) v2.0

This version includes the following configuration change:

- Support for PhiX spike-in

This User and Configuration Guide describes the integration and the preconfigured workflows, protocols, steps, and automations. The guide also lists installed components and provides configuration requirements, rules, and constraints.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, see the *NovaSeq 6000 Integration v3.3.0 Validation and Troubleshooting Guide*.

The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows (including renaming protocols, steps, and fields) could break process.

Integration Overview

The Illumina NovaSeq 6000 Integration Package v3.3.0 integration includes the following items:

- Preconfigured NovaSeq 6000 v3.1 workflow that maps to lab protocols and instrument runs.
- Preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.1)
  - NovaSeq Standard (NovaSeq 6000 v3.1) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.1) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)
- Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file is automatically uploaded to the instrument via the Sequencer API and is used to set up the run.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- [Optional] Preconfigured Library Prep Validation v1.1.0/v2.0.1 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.1 workflow. See the *NovaSeq 6000 Integration v3.3.0 Validation and Troubleshooting Guide*.
  - For Clarity LIMS v4.2 and v4.3 users, Library Prep Validation v1.1.1 workflow is available in PCWP v2.0.1 Package.

  - For Clarity LIMS v5.1 and above users, Library Prep Validation v2.0.1 workflow is available in IPP v2.0 Package.
- The above two versions of Library Prep Validation workflow are identical. To avoid confusion, we only show v2.0.1 as an example in this documentation.

  The term 'UDF' (user-defined field) is used in Clarity LIMS v4.x. The term 'custom fields' is used in Clarity LIMS v5.x. The terms are used interchangeably and referred to in this guide as custom fields.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.1 workflow as normalized libraries. That is, before they are assigned to the workflow:

- Samples have been accessioned into the Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.2.2 includes two workflows:

- NovaSeq 6000 v3.1
- Library Prep Validation v2.0.1 (optional, but recommended for validation purposes)

The following table describes the protocols and steps included in these workflows.

Table 177 Illumina NovaSeq 6000 Integration Package v3.3.0 Protocols and Steps

Library Prep Validation v2.0.1 Workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
Library Prep Validation v2.0.1	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.3.0) protocol. The protocol contains a single step - Library Prep Validation v2.0.1. After this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.1 workflow - Define Run Format (NovaSeq 6000 v3.1).	• Library Prep Validation v2.0.1
NovaSeq 6000 v3.0 Workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
Run Format (NovaSeq 6000 v3.1)	Allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM): • Loading Workflow Type: Select from NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or 400 (Nano workflows), or enter a different value. Compares each sample Normalized Molarity value with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	• Define Run Format (NovaSeq 6000 v3.1)

Library Prep Validation v2.0.1 Workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq 6000 v3.0 Workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq Standard (NovaSeq 6000 v3.1)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. Run setup information is validated and sample sheet is generated. Routing script sends library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) 2. Dilute and Denature (NovaSeq 6000 v3.1)
NovaSeq Xp (NovaSeq 6000 v3.1)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.1) step. Run setup information is validated and sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) 2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1) 3. Load to Flowcell (NovaSeq 6000 v3.1)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration starts the step automatically.	• AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)

Validation Workflow

The Library Prep Validation v2.0.1 workflow allows for validation of the system after installation is complete. For details, see the *NovaSeq 6000 Integration v3.3.0 Validation and Troubleshooting Guide*.

Step Automation

The following table lists the step automation included in the NovaSeq 6000 v3.1 workflow. Automation details are provided in the sections following the table.

See *NovaSeq Integration v3.3.0 Validation and Troubleshooting Guide* for details on the validation workflow,

Table 178 NovaSeq 6000 v3.1 workflow step automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.1)	• Define Run Format (NovaSeq 6000 v3.1)	• Routing Script • Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v3.1)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute and Denature (NovaSeq 6000 v3.1)	• Routing Script • Check Library Tube Barcode • Validate Run Setup and Generate Sample Sheet • Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.1)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.1)	• Validate Flowcell Barcode • Validate Inputs and Selected Container • Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)	• AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)	• Update Lane Number • Set Next Steps (Not used. By default, this functionality is determined by the Sequencer API. If necessary, enable the automation and use it to override the next step behavior used by the Sequencer API.)

Configuration Details

The following sections describe the configuration installed with the Illumina NovaSeq 6000 Integration.

The Illumina NovaSeq 6000 Integration Package v3.3.0 supports Clarity LIMS v4 (4.2 and later), and v5 (5.3 and later).

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface (the API resource is still called UDF). There are two types of custom fields:

- Master Step Fields—Configured on master steps. These fields only apply to the master step on which they are configured and the steps derived from those master steps.
- Global Fields—Configured on entities such as submitted sample, derived sample, and measurement. These fields apply to the whole Clarity LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.1)

This protocol sets the Loading Workflow Type and allows the choice of the appropriate Flowcell Type and Final Loading Concentration (pM). After the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.1) or the NovaSeq Xp (NovaSeq 6000 v3.1) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.1). The step is described in the following section.

Step 1. Define Run Format (NovaSeq 6000 v3.1)

Step input: NTP (normalized libraries)

Step output: None

The following automations are configured on this step:

- Routing Script
- Set Next Steps

Run Format (NovaSeq 6000 v3.1) automation configuration is described in the following section, in the order in which the automations are triggered at run time.

Set Next Steps

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) {
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares each sample Normalized Molarity value with the Minimum Molarity value. If Normalized Molarity value is lower than the Minimum Molarity value, it sets the samples Loading Workflow Type to [Remove from workflow] and records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
  input.::Warning:: = ::The Normalized Molarity is too low.:: ;
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; }
else { input.::Warning:: = ::not applicable:: }
```

At this point there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.1 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.1 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step.

Default automation command line is as follows:

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.1' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.1' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Step UDFs/Custom Fields

There are four fields defined on the Define Run Format (NovaSeq 6000 v3.1) step.

The following table lists field configuration details.

Table 179 Define Run Format (NovaSeq 6000 v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Constraints	Preset Values/Additional Options and Dropdown Items
Comment	Multiline Text	• Required: No • Read Only: No	None
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• SP • S1 • S2 • S4
Instruction	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• Default: Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.1) step.

Table 180 Global Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Adjusted Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Final Loading Concentration (pM)	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 225 • 400 • Decimal Places Displayed: 0
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Normalized Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Warning	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: Yes • Custom Entries: Yes	• The Normalized Molarity (nM) is too low. • Not applicable

User Interaction

1. On the Record Details screen, complete the following fields in the Sample Details table (values can vary across samples):
   - Loading Workflow Type: Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type: Select SP, S1, S2, or S4 from the drop-down list.
   - Final Loading Concentration (pM): Select from the two preset options: 225 (for PCR-free workflows) or 400 (for Nano workflows). Or enter a different value.
   - Normalized Molarity (nM): These values are copied over from the previous step. If not populated during library prep, enter the values here.
   - Select Next Steps. This action triggers the Next Steps automation, which completes the following actions:
     - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to successfully advance samples to the next step.
     - Calculates the Minimum Molarity.
     - Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, empty value, not including 0), generates an error message informing that the field cannot be empty.
     - Compares each sample Normalized Molarity value with the Minimum Molarity value.
2. On the Assign Next Steps screen, note the following items:
   - In the Sample Details table, the Next Step for all samples is populated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script cannot route samples correctly.

   - For samples where Normalized Molarity is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is recorded in the Warning field for the sample:

   At this point there are two options:
   - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. Set the Loading Workflow Type to NovaSeq Standard.
   - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
3. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow (ie, where Normalized Molarity value is lower than the Minimum Molarity) are removed from the Clarity LIMS workflow.

For Research Use Only. Not for use in diagnostic procedures.

- Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step. The first of two steps in the NovaSeq Standard (NovaSeq 6000 v3.1) protocol.
- Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step. The first of three steps in the NovaSeq Xp (NovaSeq 6000 v3.1) protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.1)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.1)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)

In this step, place libraries into a single pool, manually. Resuspension buffer and reagents are added.

Only create one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \
```

```
script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes

Automatically triggered when selecting the Calculate Volumes button on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool.

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl), and PhiX Volume (µl) field based on the selected Flowcell Type.

```
step.::PhiX Volume (µl):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (µl):: *= 0.8
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: * 100
+ 30;
step.::PhiX Volume (µl):: *= 0.8
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: * 150
+ 30;
step.::PhiX Volume (µl):: *= 1.1
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: * 310
+ 30;
step.::PhiX Volume (µl):: *= 2.1
};
if (step.::PhiX Volume (µl):: == 0) {
step.::PhiX Volume (µl):: = ::::
```

```
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (µl):: ) / step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value, set at 5, may be edited).
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
> 2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0}
else {output.::RSB Volume (µl):: = step.::Bulk Pool Volume (µl):: - step.::Total
Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value and calculates NaOH Volume (µl) and Tris-HCl Volume (µl) values, based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(µl):: = 100 ; output.::NaOH Volume (µl):: = 25 ; output.::Tris-HCl Volume
(µl):: = 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(µl):: = 100 ; output.::NaOH Volume (µl):: = 25 ; output.::Tris-HCl Volume
(µl):: = 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) {output.::Volume of Pool to Denature
(µl):: = 150 ; output.::NaOH Volume (µl):: = 37.50 ; output.::Tris-HCl Volume
(µl):: = 37.50 } ;
```

```
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(µl):: = 310 ; output.::NaOH Volume (µl):: = 77.50 ; output.::Tris-HCl Volume
(µl):: = 77.50 }
```

- Uses the NovaSeq_Standard_Bulk_Pool1.csv, NovaSeq_Standard_Bulk_Pool2.csv, and NovaSeq_Standard_Bulk_Pool3.csv template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of Dilute and Denature (NovaSeq 6000 v3.1).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
  -o 1.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
  -o 2.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
  -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.1):

```
nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are seven fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step. The following table lists configuration details.

Table 181 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
% PhiX (2.5 nM) Spike-In	Numeric	• Required: No • Read Only: No	• Range From: 1 to 10 • Decimal Places Displayed: 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Flowcells to Sequence	Numeric	• Required: Yes • Read Only: No	• Range From: 1 to 10 • Decimal Places Displayed: 0
Minimum Per Sample Volume (µl)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 2

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step.

Table 182 Global Custom Fields Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
RSB Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket, and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen complete the following actions:
   a. Create a pool by dragging samples into the Pool Creator.
   b. Name the pool or accept the default name (Pool #1).

For Research Use Only. Not for use in diagnostic procedures.

c. Select Record Details.
On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool are assigned the same Flowcell Type, and only one pool is created.

4. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—This value is used in volume calculations, to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—In many applications, and particularly where robotics are used, a minimum sample volume is required. This value is used to calculate how much of each sample is included in the pool.
   - % PhiX (2.5 nM) Spike-In—This value is used to calculate the volume of PhiX v3 control to include in the pool for the given percentage of spike-in. The field is optional and may be edited.
5. In the Sample Details table, select the pool icon to view details on the pool composition.
6. Select Calculate Volumes. This action triggers the Calculate Volumes automation, which completes volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and T ris-HCl Volume (µl) columns of the Sample Details table. (Values are set by a script and are not editable.)
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select the file to download it, and then open it in Excel.
7. Select Next Steps. The Set Next Step automation is triggered. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.1).
   On the Assign Next Steps screen, the next step is already set to Dilute and Denature (NovaSeq 6000 v3.1).
8. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.1) step.

Step 2: Dilute and Denature (NovaSeq 6000 v3.1)

In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB). Manually place the pooled samples into the library tube for the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

The following automations are configured on the step:

- Routing Script
- Check Library Tube Barcode
- Validate Run Setup and Generate Sample Sheet
- Validate Single Input

These automations are described in the following sections, in the order in which they are triggered at run time.

Validate Single Input

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Check Library Tube Barcode

Automatically triggered on exit of the Placement screen, this automation completes the following actions:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Za-z]{2}[0–9]{7}-[A-Za-z]{3}:

```
if (!output.container.name.matches(::[A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}::)) {
fail(::Invalid Library Tube Barcode. Verify and try again.::)
}
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;
output.::Loading Workflow Type:: = input.::Loading Workflow Type::
```

Validate Run Setup and Generate Sample Sheet

Triggered by a button on the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

For Research Use Only. Not for use in diagnostic procedures.

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. See *Respond to Validation/Recipe Request Call from Instrument* for more details.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, Index Read 1 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is zero, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
```

For Research Use Only. Not for use in diagnostic procedures.

```
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};
```

- Validates UMI Settings.
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Outputs the Settings Header in sample sheet if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. (See Sample Sheet Contents for more information.) Sample sheet template used depends on the selected value of Reverse Complement Workflow.

```
&& if [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
```

```
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeq 6000 v3.1 workflow, and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step.

Default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2}
script:changeWorkflow \
\
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.1' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Step UDFs/Custom Fields

There are 22 fields defined on the Dilute and Denature (NovaSeq 6000 v3.1) step. These fields are required for sample sheet and JSON file generation.

The following table lists field configuration details.

Table 183 Dilute and Denature (NovaSeq 6000 v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Custom Recipe Path	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: No	Not applicable
Experiment Name	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Index Read 1	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Output Folder	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Paired End	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• True • False

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Read 1 Cycle	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Read 2 Cycle	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Check Box (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: Yes
Run Mode Not displayed in user interface)	Single-line Text (v4) Toggle Switch (v5)	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4
Sitting Header (not displayed in user interface)	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	Not applicable

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
UMI—Read 1 Length	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 1 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 2 Length	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 2 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
Use Custom Index Read 1 Primer	Check Box(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None Set
Use Custom Read 1 Primer	Check Box(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None Set
Use Custom Read 2 Primer	Check Box(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None Set
Use Custom Recipe	Check Box(v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: No
Workflow	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• GenerateFASTQ
Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.1) step.

Table 184 Global Custom Fields

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Placement screen, do the following actions:
   - Drag the pool into the library tube in the Placed Samples area.
   - Scan or type the barcode of the library tube into the Library Tube field.
2. Select Record Details. After exiting the Placement screen, the Check Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0–9]{7}-[A-Za-z]{3}. If not, an error message displays.
3. On the Record Details screen, the Reagent Lot Tracking section allows tracking of the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Select from the active lots displayed in each drop-down list.

   To make reagent lots available for selection in the Reagent Lot Tracking section, configure and activate them on the Reagents and Controls screen (Clarity LIMS v4) or the Configuration > Consumables screen (Clarity LIMS v5).

   - The fields that display on the Record Details screen are used to set up the run and generate the sample sheet file. Some of these fields are autopopulated and some must be completed manually. See the following table for details.

Table 185 Fields That Display on Record Details Screen of Dilute and Denature (NovaSeq 6000 v3.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.

Field	Value
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage.
Workflow	Automatically populated with preset, GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, Custom.
Index Read 1	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI—Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI—Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.

Field	Value
UMI—Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI—Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter the network path for sequencing run folder. For example: \\networkshare\run_data

4. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet.
   This selection triggers the automation script, which completes the following actions:
   - Validates the information provided to set up the run.
   - Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Details screen.
   - Sets the value of the next step to Remove from workflow. The Routing Script automation expects this value and requires it to successfully advance samples to the next step.
5. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for all samples is populated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.
6. Select Finish Step.

On exit from the step:

- The Routing Script automation is triggered and samples are routed to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1 protocol.
- In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step and data from the run is parsed back into the Clarity LIMS.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.1)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.1) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) protocol.

This protocol contains the following three steps:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)
- Step 2: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.1)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)

Manually place libraries into a pool.

Create only one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)

These automations are described in the following section, in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation completes the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1} \
-validateSingleOutput true \
-poolType bulk"
```

Calculate Volumes

For Research Use Only. Not for use in diagnostic procedures.

Triggered when the Calculate Volumes button is selected on the Record Details screen, this automation completes the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type:

```
step.::PhiX Volume (µl):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (µl):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 18 + 30;
step.::PhiX Volume (µl):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 22 + 30;
step.::PhiX Volume (µl):: *= 1.9;
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 30 + 30;
step.::PhiX Volume (µl):: *= 2.2;
};
if (step.::PhiX Volume (µl):: == 0) {
step.::PhiX Volume (µl):: = ::::;
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl) (default value set at 5, may be edited).

Assuming the default Minimum Per Sample Volume (µl) value of 5, completes the following steps for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, automatically assigns a value of 5 to the sample Adjusted Per Sample Volume (µl) field.
2. Adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Bulk_Pool.csv and NovaSeq_Xp_Bulk_Pool2.csv template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the following step - Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1).

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation completes the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are seven fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step.

The following table lists Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 186 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Lanes to Sequence	Numeric	• Required: Yes • Read Only: No	• Decimal Places Displayed: 0
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0
Minimum Per Sample Volume (µl)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step.

Table 187 Global Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
RSB Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket, and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen:
   - Drag samples over into the Pool Creator to create a pool.
   - Name the pool or accept the default name (Pool #1).
   - Select Record Details.

   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation checks that all samples in the pool are assigned the same Flowcell Type and only one pool has been created.
4. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—The value entered in this field is used in volume calculations, to make sure that volumes are sufficient for the number of times the pool is sequenced.

For Research Use Only. Not for use in diagnostic procedures.

- Minimum Per Sample Volume (µl)—In many applications, and particularly where robotics are used, a minimum sample volume is required. The value in this field is used to calculate how much of each sample is included in the pool.
- % PhiX (0.25nM) Spike-In—The value in this field is used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and maybe edited if necessary.

- The field is populated with the configured default value, 5 µl, but may be edited if necessary.

5. In the Sample Details table, select the pool icon to view details on the pool composition.
6. Select Calculate Volumes. This selection triggers the Calculate Volumes automation, which completes volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
     - Calculates the Per Sample Volume (µl) value to be added to the pool.
     - Calculates the Total Sample Volume (µl) value.
     - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
     - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
     - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, then open it in Excel.
7. Select Next Steps. This selection triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol, Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1).
   On the Assign Next Steps screen, the next step is already set to Dilute and Denature (NovaSeq 6000 v3.1).
8. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.1) step.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.1)

In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. Manually create working pools based on the number of lanes you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step

For Research Use Only. Not for use in diagnostic procedures.

- Validate Inputs Flowcell Type

The automations are described in the following section, in the order in which they are triggered at run time.

Validate Inputs Flowcell Type

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools script. This script completes the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.
- Validates that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \
script:validate_flowcell_for_input_pools \
-i {stepURI:v2} \
-u {username} \
-p {password} \
-l {compoundOutputFileLuid1}"
```

Calculate Volumes

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if ( input.::Flowcell Type:: == ::SP:: ) {
output.::BP Aliquot Volume (µl):: = 18 ;
output.::NaOH Volume (µl):: = 4.50 ;
output.::Tris-HCl Volume (µl):: = 4.50 ;
step.::DPX1 Volume (µl):: = 126 ;
```

```
step.::DPX2 Volume (µl):: = 18 ;
step.::DPX3 Volume (µl):: = 66 ;
output.::Mastermix per Lane (µl):: = 63
};

if (input.::Flowcell Type:: == ::S1::) {
output.::BP Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4.50;
output.::Tris-HCl Volume (µl):: = 4.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::BP Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5.50;
output.::Tris-HCl Volume (µl):: = 5.50;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::BP Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7.50;
output.::Tris-HCl Volume (µl):: = 7.50;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

The automation also completes the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Working_Pool.csv and NovaSeq_Xp_Working_Pool2.csv template files to generate a single CSV file containing information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the following step - Load to Flowcell (NovaSeq 6000 v3.1).

```
and /opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar \
 -i {stepURI:v2} \
 -u {username} \
 -p {password} \
 -l {compoundOutputFileLuid1} \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
 -o {compoundOutputFileLuid0}.csv \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
 -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are three fields defined on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1) step. These field values are set by a script and are not editable while running the step.

The following table lists field configuration details.

Table 188 Dilute, Denature, and ExAmp (NovaSeq v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
DPX1 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
DPX2 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX3 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1) step.

Table 189 Global Custom Fields

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
BP Aliquot Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
NaOH Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

User Interaction

1. On the Queue screen, add the pool to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, (optionally) set the number of derivatives to create (they are placed into the flow cell lanes) and select Begin Work.
   On entry to the Record Details screen, the Calculate Volumes automation is triggered. This automation sets the following values based on the selected Flowcell Type (calculation details are provided in the previous Calculate Volumes automation section):
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume, and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool. Select the file to download it and then open it in Excel.
3. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, RSB, and Tris-HCl reagent lots. Select from the active lots displayed in each drop-down list.

   > To make reagent lots available for selection in the Reagent Lot Tracking section, first configure and activate them. Do this action on the Reagents and Controls screen (Clarity LIMS v4x) or the Configuration > Consumables screen (Clarity LIMS v5x).

   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are populated. (These values are set by a script and are not editable while running this step.)
   - In the Sample Details table the following actions are available:
     - Select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. (These values are set by a script and are not editable while running the step.)
     - The working pool number is appended to the bulk pool name. This feature quickly identifies which working pools are derived from the same bulk pool.
   - In the Files area, select the Calculation File (CSV) to download it and then open it in Excel. View information about the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool.
   - Select Next Steps to trigger the Set Next Step automation.

For Research Use Only. Not for use in diagnostic procedures.

4. On the Assign Next Steps screen, the next step is set to Load to Flowcell (NovaSeq 6000 v3.0). Select Finish Step.

Step 3: Load to Flowcell (NovaSeq 6000 v3.1)

In this step, scan the flow cell barcode into the Clarity LIMS and manually place the working pools into the lanes of the flow cell for the NovaSeq run. This step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

The following items are configured on the step:

- Validate Run Setup and Generate Sample Sheet
- Validate Flowcell Barcode
- Validate Inputs and Selected Container

The automations are described in the following section, in the order in which they are triggered at run time.

Validate Inputs and Selected Container

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows.

- Checks that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value.
- Checks that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Checks that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
```

For Research Use Only. Not for use in diagnostic procedures.

```
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into the Clarity LIMS by the user, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DMXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DSXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ;
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; \
output.::Loading Workflow Type:: = input.::Loading Workflow Type::'
```

Validate Run Setup and Generate Sample Sheet

Automatically triggered by selecting a button on the Record Details screen, this automation copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, displays an error message.

For Research Use Only. Not for use in diagnostic procedures.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Validates the parameters entered on the Record Details screen, which are used to set up the run and generate the sample sheet file. See *Respond to Validation/Recipe Request Call from Instrument* section for more details.
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if (step.::Workflow Type:: == ::No Index::) {
if (step.::Index Read 1:: != 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 and Index Read 2 must be 0 if No Index is selected.::)
}
} else if (step.::Workflow Type:: == ::Single Index::) {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: != 0) {
fail(::Index Read 1 must be greater than 0 and Index Read 2 must be 0 if Single
Index is selected.::)
}
} else {
if (step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)
}
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error displays.
  - If Paired End = False, Read 2 Cycles must be zero and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

For Research Use Only. Not for use in diagnostic procedures.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
};
```

- Validates UMI Settings:
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Outputs the Settings Header in sample sheet if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? ::[Settings]:: : ::::;
```

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - AUTOMATED - Run (NovaSeq 6000) v3.0.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. (See Sample Sheet Contents for more information.) The sample sheet template depends on the selected value for Reverse Complete Workflow.

```
&& if [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \

```

```
-l {compoundOutputFileLuid1}"
```

Step UDFs/Custom Fields

There are 23 fields defined on the Load to Flowcell (NovaSeq 6000 v3.1) step.

The following table lists the field configuration details.

Table 190 Load to Flowcell (NovaSeq 6000 v3.1) Step Custom Field Configuration

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Single-line Text (v4) Text (v5)	• Required: No • Read Only: No	Not applicable
Experiment Name	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Index Read 1	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Library Tube Barcode	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Paired Ends	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• True • False
Read 1 Cycles	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Read 2 Cycles	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Reverse Complement Workflow	Check Box (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: Yes
Run Mode (not displayed in user interface)	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Setting Header (not displayed in user interface)	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 1 Length	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 1 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 2 Length	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 2 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
Use Custom Index Read 1 Primer	Check Box (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Read 1 Primer	Check Box (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Read 2 Primer	Check Box (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Recipe	Check Box (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: No
Workflow	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• GenerateFASTQ
Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Global Custom Fields

The following table lists the global custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.1) step.

Table 191 Global Custom Fields Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Ice Bucket screen, complete the following actions:
   - Select the appropriate flow cell type from the Destination Container drop-down list in the Container Options panel.
   - Select Begin Work.
2. On the Placement screen, complete the following actions:
   - Drag one or more of the pools from the left of the screen into the Placed Samples area to the right.
   - Scan or type the barcode of the flow cell into the flow cell field.
   - Select Record Details.

   On exit of the Placement screen, the Validate Flowcell Barcode automation validates the container barcode (described previously).
3. Set up the run and generate the sample sheet file using the fields that display on the Record Details screen. Some of these fields are autopopulated and some must be completed manually.
   The following table lists the fields that display on Record Details screen of Load to Flowcell (NovaSeq 6000 v3.1) step.

For Research Use Only. Not for use in diagnostic procedures.

Table 192 Fields That Display on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage.
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, Custom.
Index Read 1	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If Use Custom Recipe selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.

Field	Value
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter the network path for sequencing run folder. For example: \\networkshare\run_data
Library Tube Barcode	Scan the library tube barcode.

4. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet.
   This selection triggers the automation script, which completes the following actions:
   - Validates the information provided to set up the run.
   - Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Details screen.
5. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for all samples is populated with Mark protocol as complete.
6. Select Finish Step.
   In Lab View, the pooled samples are queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step and data from the run is parsed back into the Clarity LIMS.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)

This final protocol contains one fully automated step, AUTOMATED- NovaSeq Run (NovaSeq 6000 v3.1), described in the following section.

This is a fully automated step. Do not add samples to the Ice Bucket or start the step manually.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

Do not start this step manually. It is a fully automated step and the sequencing service does not update samples correctly if they have been manually started.

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

The Automated - NovaSeq Run (NovaSeq 600 v3.1) step contains two automations:

- Set Next Steps
- Update Lane Number

By default, the Set Next Steps automation is disabled (set to Not Used) and the Sequencer API sets the next step for samples.

Set Next Steps

If necessary, override the default next step behavior used by the Sequencer API by performing the following steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to trigger automatically on exit of the Record Details screen.

Update Lane Number

This automation triggers automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Step UDFs/Custom Fields

The following table lists the run parameters parsed from the RunParameter.xml file and mapped to fields configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step.

Table 193 Run Parameters - Field Mappings

Step UDF/ Custom Field Name
Current Cycle
Current Read
Firmware Version
Flow Cell Expiration Date
Flow Cell ID
Flow Cell Lot Number
Flow Cell Mode
Flow Cell Part Number

Step UDF/ Custom Field Name
Flow Cell Side
Instrument Control Software Version
Instrument ID
Instrument Type
Lane Counter
Loading Workflow Type
Output Folder
RTA Version
Run ID
Run Status
Sequencing Log

Global Custom Fields

The following global custom fields are used to capture the run metrics in Clarity LIMS.

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1

For Research Use Only. Not for use in diagnostic procedures.

- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following details:

- Values are aggregated across all lanes. Some values, for example Yield PF (Gb) R1, are summed while others are averaged.
- The names listed previously are the default global custom field names installed with the NovaSeq Integration v3.3.0 configuration provided in the Preconfigured Workflow Package (PCWP) v2.0.1 or later.
- All global configuration fields are configured on the Container entity.
- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If you change the field names in Clarity LIMS, also change them through the run.metricUdfNames properties file in the application.yml file for the Sequencer API (see *application.yml Properties on page 688*). All fields are configured to be visible on the Record Details screen for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step (in the Sample Details table).

These global custom fields are configured on the Container entity, visible on each input, but they should not be confused with per-lane metrics.

All run metrics tracked in Clarity LIMS are overall metrics for the run. There are no per-lane metrics provided by NovaSeq Control Software currently.

How the Sequencer API Integration Works

Sample Sheet Generation

The sample sheet is generated on the step before the run, which is Dilute and Denature (NovaSeq 6000 v3.1) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.1) in the NovaSeq Xp protocol. This step places samples on the library tube or flow cell that are loaded in the NovaSeq instrument.

In the default configuration, the *Validate Run Setup and Generate Sample Sheet on page 669* automation generates one CSV format sample sheet file for use with bcl2fastq v2.20 downstream analysis.

How it Works

The sample sheet is uploaded to the NVCS via the /Illumina/Sequencer/v2/sequencing-run/files endpoint to the Sequencer API. The file endpoint allows for a file to be downloaded from the Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Contents

The sample sheet content is controlled by the following step UDFs/custom fields that display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow
- Reverse Complement Workflow

See *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542 for detailed information on the following items:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at /Illumina/Sequencer/v2/sequencing-run/login). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen to the user. Log in to automatically authorize the NVCS to use your account to access the Clarity LIMS.
2. Enter credentials:
   - Username and password are passed to the Clarity LIMS server to make sure that the access is valid.
   - By default, the Sequencer API service tries to contact the Clarity LIMS at http://localhost:9080/clarity/. This URL is set by the installation script, but it can be configured with the clarity.url property in the application.yml file (see *application.yml Properties on page 688*).
3. User is redirected to the Sequencer login page at /Illumina/Sequencer/v2/sequencer_login.

- If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to /Illumina/Sequencer/v2/sequencer_login/Success. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
- If authentication fails, the user is left on the login screen and a warning message informs them of the failure. A background redirect to /Illumina/Sequencer/v2/sequencer_login/Error informs the NovaSeq of the failure.

Respond to Validation/Recipe Request Call from Instrument

1. The sequencing-run/recipe/novaseq endpoint consumes a POST request with a LibraryContainerI, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagent information is provided by the NovaSeq. LibraryContainerId is required.
   - LibraryContainerId and FlowCellId should match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows.
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

   Configure the steps that are considered sequencing run steps in the novaseq.sequenceStepNames property in the application.yml file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. See *application.yml Properties on page 688* for more details.
3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API and the run recipe is generated.
   Note the following details:
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.1) or Load to Flowcell (NovaSeq 6000 v3.1) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.3.0 configuration included in PCWP and IPP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe and the value of a property defines the name of the field that is used to populate that entry in the recipe.

For Research Use Only. Not for use in diagnostic procedures.

- It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
- The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the application.yml (see *application.yml Properties on page 688* for more details). If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The contents of the run recipe are controlled by the sample sheet contents and the fields configured on the Dilute and Denature (NovaSeq 6000 v3.1) and Load to Flowcell (NovaSeq 6000 v3.1) steps:

Example of run recipe content is as follows:

```
{
  "run_name": "NVCS16027_SPrime_2x250",
  "run_mode": "S4",
  "workflow_type": "DualIndex",
  "librarytube_id": "NV0025867-LIB",
  "flowcell_id": "",
  "sample_loading_type": "NovaSeqStandard",
  "rehyb": false,
  "paired_end": true,
  "read1": 151,
  "read2": 151,
  "index_read1": 8,
  "index_read2": 8,
  "output_folder": "\\\\network_path\\run_data",
  "samplesheet": "<path to sample sheet on LIMS server>",
  "require_samplesheet_authentication": true,
  "usecustomrecipe": false,
  "customRecipe": null,
  "use_basespace": false,
  "basespace_mode": null,
  "use_custom_read1_primer": false,
  "use_custom_read2_primer": false,
  "use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Instrument

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

   > If no matching container is found or if the samples in the container are incorrectly queued, an error is thrown and the step is not started. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged and the step cannot be completed by the API without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored and a warning is logged during lot tracking.
3. The number of replicates for the step is determined by the type of flow cell being used in the run.
   - For Standard mode, this information is based on the number of lanes in the flow cell. This information is stored as part of the Sequencer API configuration.
   - For XP mode, there is always one replicate, because there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step. The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents is tracked in Clarity LIMS as containers and custom fields. Any other reagents in the request are handled as follows.
   - If the reagent is not configured to be tracked, a warning is logged and the reagent is ignored.
   - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
   - If one or more matching reagent lots exist in Clarity LIMS, the newest one is used.
   - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

   Otherwise a new lot is created with the following configuration:
   - Reagent Kit—Matching kit as determined from Sequencer API configuration and step 2.
   - Name—Serial number in request.

For Research Use Only. Not for use in diagnostic procedures.

- Lot Number—Lot number in request.
- Expiry—Expiry date in request.
- Status—Active.

If any reagents are expected to be in the request but are not, these reagents are logged. This action prevents the step from being completed without user intervention.

6. Step UDFs/custom fields are updated with the run information parsed from the request. See *Respond to Record InterOps Metrics Call from Instrument* on page 686.
7. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline global custom field on the step (assuming the step was started successfully). See *Respond to Record InterOps Metrics Call from Instrument* on page 686.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it completes the following actions:

- Looks for a matching library tube or flow cell in Clarity LIMS.
- Find the in-progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container global custom fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run is successful, after the metrics are recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status step UDFs/custom fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A success message is recorded in the log file at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, the Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. If there are no next steps, the protocol is completed.

Respond to Sequencing Errored Call from Instrument

If the sequencing run is unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status step UDF/custom fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A failure message is recorded in the log file at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

For Research Use Only. Not for use in diagnostic procedures.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the sequencing run is ended by the user, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status step UDFs/custom fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed with this Integration

The following sections describe the various components (files, properties, reagent categories / label groups, reagent kits, and containers) that are installed by default as part of this integration. Information on installed workflows, protocols, steps, and automations is provided in the previous Workflows, Protocols, and Steps section.

Illumina NovaSeq Integration v3.3.0 is distributed as an RPM package, BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- Configuration file - application.yml
- Two configuration scripts: configure_sequencer_api_proxy.sh and configure_sequencer_api_application.sh

> The NovaSeq v3 configuration is delivered through the Preconfigured Workflows Package (PCWP) v2.0.1, and Illumina Preset protocols (IPP) v2.0, which requires installation of the NGS Extensions Package v5.20.1 or later.
>
> - If the NGS Extensions Package is not already installed, or if a version earlier than v5.20.1 is installed, the latest version is installed by default with the NovaSeq integration. See Release Notes for details.
> - If NGS Extensions Package v5.20.1 or later is already installed, upgrade is not forced or required.

The following table lists the components installed by the RPM package.

Table 194 Illumina NovaSeq 6000 Integration RPM Components

Files Installed	Location and Description
Illumina#Sequencer#v2.war	/opt/gls/clarity/tomcat/current/webapps War file for NovaSeq v3.3.0 API.
configure_sequencer_api_application.sh	/opt/gls/clarity/config/ Script that configures the Sequencer API application through its external application.yml file.
configure_sequencer_api_env.sh	/opt/gls/clarity/config/ Script that configures the Clarity LIMSTomcat configuration to include Secret Util settings.
configure_sequencer_api_proxy.sh	/opt/gls/clarity/config/ Script that configures the proxy to allow communication with the Sequencer API (NovaSeq v3.3.0 API) application.
sequencer-api.conf	/etc/httpd/clarity/ Proxy setting to communicate with the Clarity LIMS.

application.yml Properties

The application.yml file is located at opt/gls/clarity/extensions/sequencing-api/.

- All properties are configured automatically during installation, but you can also configure them by editing the application.yml file and then restarting Tomcat.
- All custom field names, both for recipe and run information, are represented by properties in the file.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, you can change Loading Workflow Type but you cannot change recipe.udfNames.sampleLoadingType.

Table 195 application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change)
clarity.url	Base URL that the Sequencer API service uses to contact the Clarity LIMS. The installation script (configure_sequencer_api_application) prompts for this.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
clarity.username	Username to be used when communicating with Clarity LIMS.
clarity.password	Encrypted password to be used when communicating with Clarity LIMS.
security.signing-key	Private key that should be used when signing/validating OAuth tokens. Changing this invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration may find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS (not the master step/process type). • Each line should be indented to the same point and start with a dash (-). Default value: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)

novaseq.flowcells	List of supported NovaSeq flow cell types.
	• Type names exactly match the values used by the NVCS run status requests.
	• To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-).
	Default value:
	`- type: "SP"`
	`lanes: 2`
	`- type: "S1"`
	`lanes: 2`
	`- type: "S2"`
	`lanes: 2`
	`- type: "S4`
	`"lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps. - lotName: The name of the lot as it appears in the run started request. - kitName: The name of the corresponding reagent kit in Clarity LIMS that the lot should be tracked as. • The name may differ in the NVCS request vs. the Clarity LIMS configuration. Default value: `- lotName: "Buffer"kitName: "Buffer Cartridge"- lotName: "Cluster"kitName: "Cluster Cartridge"- lotName: "SBS"kitName: "SBS Cartridge"`
recipe.udfNames	Configures the names of the fields used in the run recipe. See *Run Recipe Contents* section for more information). • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.
run.stepUdfNames	Configures the step UDF/custom field names to be used when recording run results. • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.metricUdfNames	Configures the result file UDFs/measurement global field names to be used when recording run results. These are the fields that capture the run data.
run.autoComplete	Determines whether the sequencing run step should be completed automatically after parsing the run metrics on a run (see also run.autoCompleteOnlyAtSuccess). Default value: true See the *Auto Complete* section for more information.
run.autoCompleteOnlyAtSuccess	Determines which of the following options the sequencing run step should be: • Autocompleted when the run status is RunCompletedSuccessfully (ifautoCompleteOnlyAtSuccess is true) • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true See the *Auto Complete* section for more information.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2

- S4

This integration supports the following items:

- Library tube with barcode provided in the format [A-Za-z]{2}[0–9]{7}-[A-Za-z]{3}
  Example: AB1234567-XYZ
- SP, S1, S2, or S4 flow cell with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Za-z0-9]{5}DRX[XY2357]
  - S2 flow cell: [A-Za-z0-9]{5}DMX[XY2357]
  - S4 flow cell: [A-Za-z0-9]{5}DSX[XY2357]

  Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

1. On the steps that use the routing script - Define Run Format (NovaSeq 6000 v3.1) and Dilute and Denature (NovaSeq 6000 v3.1) - the Next Step for all samples must be set to Remove from workflow. This value is set by a script. The value must not change in the Assign Next Steps screen.
2. Clarity LIMS v5: In the protocol configuration screen, the following settings are required and must not be changed:
   In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.
3. Clarity LIMS v4: In the protocol configuration area, for all protocol steps on which the Routing Script automation is configured, the following setting is required and must not be changed:
   On the Next Steps configuration tab, the Next Steps are set by a script toggle switch must be set to Yes.

Configuring Auto Complete Properties

As of NovaSeq Integration v3.3.0, the application.yml configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow, AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1), is automatically completed:

- Only when the run status is "RunCompletedSuccessfully" (default behavior)

For Research Use Only. Not for use in diagnostic procedures.

-or -

- Regardless of the run status

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

If you would like the step to autocomplete regardless of the result of the sequencing run, you must change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the application.yml file located at /opt/gls/clarity/extensions/sequencer-api/application.yml:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.
3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autocomplete behavior of the sequencing step.

Table 196 run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true (default)	true (default)	• Step autocompletes only if sequencing run is successful. • If run is not successful, step does not autocomplete and run details are recorded in Clarity LIMS.
true	false	• Step autocompletes, regardless of the run status.
false	true	• Step does not autocomplete. • Run details are recorded in Clarity LIMS.
false	false	

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.

- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the Bcl2fastq2 Sample Sheet Generation article.
- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step. This step is a fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, select Validate Run Setup and Generate Sample Sheet.

Resources

- *NovaSeq 6000 Sequencing System Guide*

NovaSeq 6000 Integration v3.3.0 Validation and Troubleshooting

This guide explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.3.0.

The validation process involves the following items:

- Running samples through the Library Prep Validation workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries advance to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.1 workflow validates the following items:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.1) step to the NovaSeq Standard (NovaSeq 6000 v3.1) or NovaSeq Xp (NovaSeq 6000 v3.1) step.
  - Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file automatically uploads to the sequencing system via the Sequencer API.
  - Automatic validation of run setup information. Information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

The validation steps assume installation of the Illumina NovaSeq 6000 Integration Package v3.3.0 and the default Clarity LIMS configuration.

Validation Steps

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation and NovaSeq 6000 v3.1 workflows.

Step 1: Activate the Workflow

In the Clarity LIMS configuration area, activate the Library Prep Validation and NovaSeq 6000 v3.1 workflows.

- For Clarity LIMS v4.x (v4.2 and later), Library Prep Validation v1.1.1 can be imported from Clarity LIMS v4 with PCWP v2.0.1 installed.
- For Clarity LIMS v5.0, follow the manual upgrade guide to upgrade the existing NovaSeq v3.0.1 workflow to the latest workflow, then proceed to the following validation steps. Contact an Illumina field service engineer for assistance with this upgrade.
- For Clarity LIMS v5.1 and later, Library Prep Validation v2.0.1 can be imported from Clarity LIMS v5.0 with IPP v2.0 installed.

Step 2: Create a Project and Add Samples

1. On the Projects & Samples screen, create a project and add samples to it.
2. Assign the samples to the Library Prep Validation workflow.

Library Prep Protocol: Library Prep Validation v1.1.1/v2.0.1

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.1 workflow.

Step 1: Run Library Prep Validation v2.0.1

1. In Lab View, locate the Library Prep Validation v2.0.1 protocol.
   The Library Prep Validation v2.0.1 step opens.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, complete the following actions:
   a. In the Placed Samples area on the right, in the Container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, and drag them to the container wells on the right side.
   c. Select Add Labels.
5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. The group is the only label group configured in the integration and is used by default in this step.

For Research Use Only. Not for use in diagnostic procedures.

a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.

b. Select Record Details.

6. On the Record Details screen, complete the following actions:

a. In the Sample Details table, enter values for Normalized Molarity. Type values individually or copy and paste to enter multiple values from a spreadsheet.

b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.

c. Populate the fields in this column using one of the following methods:

- To populate fields individually for each sample, select from the drop-down list in each row.
- To populate all fields at one time, copy and paste from a spreadsheet.

Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

If working with many samples, copy and paste to insert multiple values from a spreadsheet as follows.

a. Select Copy Samples to copy the sample information from Clarity LIMS to the Clipboard.

b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.

c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. Within Clarity LIMS, select the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then select Update to paste the contents into the Sample Details table.

7. Select Next Steps.
Triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.

8. On the Assign Next Steps screen in the Samples table, the Next Step value for all samples is prepopulated with Remove from workflow.

Do not change this value. If Next Step is not set to Remove from workflow, the routing script does not route samples correctly.

9. Select Finish Step.
Upon exiting the step, Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.1 workflow, Define Run Format (NovaSeq 6000 v3.1). It is the only step in Protocol 1: Run Format (NovaSeq 6000 v3.1).

Protocol 1: Run Format (NovaSeq 6000 v3.1)

This protocol includes a single step, Define Run Format (NovaSeq 6000 v3.1). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v3.1)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.1) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options: 225 (for PCR-free workflows), 400 (for Nano workflows), or enter a different value.
   - Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.
5. Select Next Steps, which triggers the Next Steps automation and the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (in other words, empty value, not including 0), generates an error message notifying that the field cannot be empty.
   - Compares each sample Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not routed samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. Also, a message is recorded in the Warning field for the sample.
     At this point, there are two options:

For Research Use Only. Not for use in diagnostic procedures.

- Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. The Loading Workflow Type must be set to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.

7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow are removed from the Clarity LIMS workflow. (Occurs when the Normalized Molarity value is lower than the Minimum Molarity.)
   - Samples whose Loading Workflow Type is NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step. These steps are the first two in NovaSeq standard protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.1)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)
2. Dilute and Denature (NovaSeq 6000 v3.1)

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.1) protocol. Samples for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.1) step are queued.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      ⚠ Only create one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
      After exiting from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation verifies the following items:
      - All samples in the pool have been assigned the same Flowcell Type.
      - Only one pool has been created.

For Research Use Only. Not for use in diagnostic procedures.

5. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Flowcells to Sequence—Used in volume calculations, to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (2.5 nM) Spike-In—Used to calculate the volume of PhiX v3 control included in the pool for the given percentage of spike-in. The field is optional and can be edited.

   Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
   - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
   - Clarity LIMS changes the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type.
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field.
   - Calculates the PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, selects the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. The script sets the values, and is not editable.
   - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select on the file to download it and then open it in Excel.
8. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol, Dilute, and Denature (NovaSeq 6000 v3.1).
   On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.1).
9. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.1) step.

For Research Use Only. Not for use in diagnostic procedures.

Step 2: Run Dilute and Denature (NovaSeq 6000 v3.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.1) protocol. The pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.1) step are listed.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation verifies that only one container is input for the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   After exiting the Placement screen, the Validate Library Tube Barcode automation makes sure that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}. If it does not, an error message displays. The automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
      - LIMS v5: Navigate to the Consumables configuration screen.
      - LIMS v4: Navigate to the Reagents and Controls screen.
   b. Select the NaOH reagent kit and select New Lot.
   c. Enter the lot details and select Save.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
   f. Return to your original working browser tab and refresh the page.
6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be completed manually.

Table 197 Fields Displayed on Record Details Screen of Denature and Dilute (NovaSeq 6000 v3.1)

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Workflow	Automatically populated with the preset GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8, or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8, or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51, or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51, or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
Paired End	Select if applicable.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which does the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.
9. Select Next Steps.
   On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow. The Routing Script automation expects this value, and requires the value to advance samples to the next step.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.
10. Select Finish Step.
    After exiting the step, the following actions occur:
    - The Routing Script automation is triggered and samples are routed to AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step.

    At this point in the workflow, the user interaction ends. Proceed to NovaSeq Run (NovaSeq 6000 v3.1).

    Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step. The integration adds samples automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.1)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.1) step.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)
2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1)
3. Load to Flowcell (NovaSeq 6000 v3.1)

For Research Use Only. Not for use in diagnostic procedures.

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.1) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.1) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Create only one pool.

   b. Enter a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
5. On exiting the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation verifies the following items:
   - All samples in the pool are assigned the same Flowcell Type.
   - Only one pool was created.
6. On the Record Details screen in the Step Details area, complete the two required fields and one optional field, as needed:
   - Number of Lanes to Sequence—Used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—Used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value 5 µl, but can be edited.
   - % PhiX (0.25nM) Spike-In—Used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

   Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
   - If the smallest Per Sample Volume (µl) value is < 5, Clarity LIMS automatically assigns a value of 5 to the samples Adjusted Per Sample Volume (µl) field.
   - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
7. In the Sample Details table, select the pool icon to view details on the pool composition.
8. Select Calculate Volumes. Triggers the Calculate Volumes automation. This automation performs volume calculations based on the selected Flowcell Type, as follows.
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.

For Research Use Only. Not for use in diagnostic procedures.

- If the Total Sample Volume is less than the Bulk Pool Volume, calculate the RSB Volume (µl) value.
- The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.

9. Select Next Steps to trigger the Set Next Step automation. This automation performs the following actions:
    - Copies the Flowcell Type values from the step inputs to the step outputs.
    - Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1).

    On the Assign Next Steps screen, the next step for samples is set to the next step in the workflow Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1).
10. Select Finish Step.
    At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.1)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.1) protocol. The pool of samples queued for the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.1) step displays.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
    This automation sets the following values based on the selected Flowcell Type:
    - BP Aliquot Volume (µl)
    - NaOH Volume (µl)
    - Tris-HCl Volume (µl)
    - DPX1 Volume (µl)
    - DPX2 Volume (µl)
    - DPX3 Volume (µl)
    - Mastermix per Lane (µl)
    - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.

For Research Use Only. Not for use in diagnostic procedures.

- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool (see the next step).

5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. These reagents must be added.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
      - Clarity LIMS v5: Navigate to the Consumables configuration screen.
      - Clarity LIMS v4: Navigate to the Reagents and Controls screen.
   b. Select one of the reagent kits previously listed and select New Lot.
   c. Enter the lot details and select Save.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Repeat this process to add and activate the remaining reagent lots.
   f. Return to your original working browser tab and refresh the page.
6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are prepopulated. The script sets the values and they are not editable.
   - In the Sample Details table, select the pool icon to view details on the working pool composition.
     - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are populated. The script sets the values and they are not editable.
     - The Flowcell Type and Loading Workflow Type columns are populated.
     - The working pool number is appended to the bulk pool name, to identify which working pools are derived from the same bulk pool.
7. In the Files area, select the Calculation File (CSV) to open it and view details on the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
8. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.1).
9. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.1)

1. On the Ice Bucket screen:
   - In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.

For Research Use Only. Not for use in diagnostic procedures.

- Select Begin Work.

2. The Validate Inputs and Selected Container automation checks the following:
   - The Flowcell Type field is set to a valid value (SP, S1, S2, or S4) and that each input has the same value for the field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reports the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag one or more pools from the left of the screen over into the Placed Samples area on the right.
   - Scan or type the barcode of the flow cell into the Flowcell field.
   - Select Record Details.

   After exiting the Placement screen, the Validate Flowcell Barcode automation makes sure that the container barcode conforms to the barcode mask for the selected Flowcell Type (as listed in the following table). This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flowcell Type	Barcode Mask
SP	[A-Za-z0-9]{5}DRX[XY2357]
S1	[A-Za-z0-9]{5}DRX[XY2357]
S2	[A-Za-z0-9]{5}DMX[XY2357]
S4	[A-Za-z0-9]{5}DSX[XY2357]

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be entered manually (see the following table for details).

Table 198 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Compliment Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Library Tube Barcode	Scan the library tube barcode.

5. Select Validate Run Setup and Generate Sample Sheet, then select Next Steps to trigger the automation script, which:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area on the Record Details screen.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.
   At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step.

Proceed to AUTOMATED - .NovaSeq Run (NovaSeq 6000 v3.1).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step. The integration adds samples automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. User interaction is not required, but the various stages can be reviewed in Clarity LIMS (see the Review Run Data section).

Automated - NovaSeq Run (NovaSeq 6000 v3.1) contains two automations:

1. Set Next Steps automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.
   - The PCWP includes a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step. This automation can be used to override the default next step behavior. See NovaSeq 6000 User and Configuration Guide for details.
2. Update Lane Number automation is triggered automatically upon entry to the Record Details screen.
   - Do not disable or modify this automation to make sure that the Lane Number is displayed properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

The following values populate in the step UDFs/master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number*
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

Summary metrics populate the UDFs/global fields listed. Values are aggregated across all lanes. Some values (for example Yield PF (Gb) R1) are summed, while others are averaged.

- Yield PF (Gb) R1
- Yield PF (Gb) R2*
- Reads PF (M) R1*
- Reads PF (M) R2*
- Cluster Density (K/mm^2) R1

For Research Use Only. Not for use in diagnostic procedures.

- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

For R2 Yield, R2 Error rate, and R2 Q30, there are discrepancies between the values shown in Illumina SAV software and the payload sent from the NVCS to Clarity LIMS. This issue is fixed in the upcoming NVCS release.

How the Integration Works

The following steps summarize how the Sequencer API integration works. See NovaSeq 6000 User and Configuration Guide for details.

1. When setting up a run on the NovaSeq instrument, NVCS sends a request for the run recipe.
   a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1 step.
   b. Clarity LIMS sends a JSON response to NVCS. The response includes the run recipe information and a link to download the sample sheet (used with analysis software such as bcl2fastq2).
2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then does the following:
   a. Validates reagent kit information in the RunStarted request:
      - Verifies that the reagent kit exists. If the reagent kit does not exist, the Sequencer API creates and enables it on the master step.
      - Verifies that the reagent kit is activated. If the reagent kit is not active, the Sequencer API activates it.

b. Initiates the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.

c. Records all relevant information from the RunStarted request on the step (such as reagent lots and step fields).

3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut

   The Sequencer API updates the step with any new information, which includes only the status and cycle/read information.

4. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends a request only when the run completed successfully, but the API does not make this assumption and accepts the request regardless of status. The Sequencer API then does the following:

   a. Records the metrics into the fields on file placeholder outputs in the LIMS.

   b. Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This action is the default autocomplete step behavior. See NovaSeq 6000 User and Configuration Guide for details.

   > The NovaSeq 6000 User and Configuration Guide provides detailed information on how the following components work with the Sequencer API integration:
   >
   > - Sample sheet generation and contents
   > - NovaSeq run
   > - User authentication and login
   > - Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, see the following articles:

- Troubleshooting Automated Informatics.
- Troubleshooting EPP/Automation in the API

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step, review the log file information. See *Logging* on page 712 for more details.

If the automated run step starts, but does not complete:

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS, using either the Library Tube, or Flowcell barcode as the search term. The steps depend on whether the search is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information. If unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the sequencer-api.log file, described in the following sections.
3. Contact the Clarity LIMS support team, supplying the relevant information from the troubleshooting steps already performed.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.1) step, the Sequencer API writes a detailed log file to /opt/gls/clarity/tomcat/current/logs/sequencer-api.log.

Log messages include the Library Tube ID and Flowcell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencing system has a name that includes the sequencing container ID (Library Tube for Standard or Flowcell for XP). The relevant container name search finds most the log messages for this request. However, if all messages for downloading a file are found, then the LIMS ID of the file must be known. The LIMS ID is found in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response (which can also be found in the log file).

Example lines from the log file:

```
2018-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2018-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell
Id=RM123DSXX] LimsApiLookupUtil : Searching for containers with name 'NV1234567-
LIB' or 'RM123DSXX'
....
2018-06-19 21:35:27.158 INFO --- [] FileService : Successfully retrieved file
'NV1234567-LIB.csv' with LIMS ID 40-51 through the API.
```

NovaSeq 6000 Integration v3.3.0 Release Notes

These Release Notes detail the key changes to software components for the BaseSpace Clarity LIMS NovaSeq 6000 Integration Package since version 3.2 of that package.

This is an optional software update for customers interested in the new features available with this new release.

If you are upgrading from a version prior to version 3.2 please review the release notes for version 3.2 for a list of features and bug fixes introduced in that version.

Compatibility

- Clarity LIMS v4.2 through v5.4
- NGS Extensions Package v5.19 or later
- Preconfigured Workflow Package (PCWP) v2.0.1 or later
- Illumina Preset Protocols (IPP) v2.0.0 or later
- NovaSeq Control Software (NVCS) v1.7.0
- Illumina Bcl2FastQ v2.20

New Features

This release of the Clarity LIMS integration package:

- Supports the security improvements made to the management of passwords in Clarity LIMS v5.4.
- Provides a PhiX spike-in volume calculation script.
- Makes the ReadsPFR1 and ReadsPFR2 available for use.
- Provides error logging enhancements.
- Delivers an updated workflow (NovaSeq 6000 v3.1) directly from PCWP v2.0.1 or IPP v2.0.0.

Defect Repairs

The hard dependency on PCWP version 1.0 is corrected, allowing the use of later versions of PCWP.

Known Issues

None

NovaSeq 6000 Integration v3.2.2 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.2.2 supports the integration of Clarity LIMS to Illumina NovaSeq 6000 instruments.

Note the following key changes for this version of the integration:

- Release of the NovaSeq v3.0.1 workflow to support NVCS 1.7 and v1.5 reagents.
- A workflow as part of the Preconfigured Workflows Package (PCWP) v1.2.2.

Configuration changes in v3.2.2 include the following items:

- Support for both Reverse Complement and Forward Workflows
- Support for Unique Molecular Identifiers (UMI)

This user and configuration guide describes the integration and includes information about the preconfigured workflows, protocols, steps, and automations. The guide also lists installed components, and provides configuration requirements, rules, and constraints.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, see the *NovaSeq Integration v3.2.2 Validation and Troubleshooting Guide*.

The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows—including renaming protocols, steps, and fields—could break processes.

Integration Overview

The integration includes the following:

- Preconfigured NovaSeq 6000 v3.0.1 workflow that maps to lab protocols and instrument runs.
- Preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.0.1)
  - NovaSeq Standard (NovaSeq 6000 v3.0.1) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.0.1) (supports individual lane loading on the NovaSeq)
  - Automated—NovaSeq Run (NovaSeq 6000 v3.0.1)
- Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file is automatically uploaded to the sequencing instrument via the Sequencer API and is used to set up the run.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, including:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Sequencing run data directory location
  - Real-Time Analysis v3 (RTA3) version and other run-specific information

- [Optional] Preconfigured Library Prep Validation v1.0.1 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.0.1 workflow. See the *NovaSeq Integration v3.2.2 Validation and Troubleshooting Guide*.

Information on these features is provided in the following sections.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.0.1 workflow as normalized libraries. That is, before they are assigned to the workflow:

- Samples have been accessioned into Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For details on sample accessioning, see the articles in the Samples section of the Clarity LIMS documentation for your version.

Samples can be assigned to the NovaSeq 6000 v3.0 workflow automatically (using a routing script) or manually from the Projects and Samples dashboard. See the *Assigning Samples to Workflows* article in the Clarity LIMS documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.2.2 includes two workflows:

- NovaSeq 6000 v3.0.1
- Library Prep Validation v1.0.1 (optional, but recommended for validation purposes)

The following table lists and describes the protocols and steps included in these workflows.

Table 199 Table 1: Illumina NovaSeq 6000 Integration Package v3.2.2 Protocols and Steps

Library Prep Validation v1.0.1 workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
Library Prep Validation v1.0.1	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.0.1) protocol. The protocol contains a single step - Library Prep Validation v1.0.1. At the end of this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.0.1 workflow. The first step is Define Run Format (NovaSeq 6000 v3.0.1).	1. Library Prep Validation v1.0.1
NovaSeq 6000 v3.0 workflow		
Protocol name	Protocol purpose	Steps included in protocol
Run Format (NovaSeq 6000 v3.0.1)	Allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM): • Loading Workflow Type: Select from NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: User selects from options SP, S1, S2, or S4. • Final Loading Concentration (pM): Select from options 225 (PCR-free workflows) or400 (Nano workflows), or may enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.0.1)

For Research Use Only. Not for use in diagnostic procedures.

Library Prep Validation v1.0.1 workflow		
Protocol Name	Protocol Purpose	Steps Included in Protocol
NovaSeq 6000 v3.0 workflow		
Protocol name	Protocol purpose	Steps included in protocol
NovaSeq Standard (NovaSeq 6000 v3.0.1)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. Run setup information is validated and sample sheet is generated. Routing script sends library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) 2. Dilute and Denature (NovaSeq 6000 v3.0.1)
NovaSeq Xp (NovaSeq 6000 v3.0.1)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.0.1) step. Run setup information is validated and sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) 2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) 3. Load to Flowcell (NovaSeq 6000 v3.0.1)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration does this action automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)

Validation Workflow

The Library Prep Validation v1.0.1 workflow allows for validation of the system after installation is complete. For details, see the NovaSeq Integration v3.2.2 Validation and Troubleshooting Guide.

Step Automation

The following table lists the step automation included in the NovaSeq 6000 v3.0.1 workflow. Automation details are provided in the sections following the table.

For details on the validation workflow, see the NovaSeq Integration v3.2.2 Validation and Troubleshooting Guide.

Table 200 Table 2: NovaSeq 6000 v3.0.1 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.0.1)	1. Define Run Format (NovaSeq 6000 v3.0.1)	• Routing Script • Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v3.0.1)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.
	2. Dilute and Denature (NovaSeq 6000 v3.0.1)	• Routing Script • Check Library Tube Barcode • Validate Run Setup and Generate Sample Sheet • Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.0.1)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.
	2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.0.1)	• Validate Flowcell Barcode • Validate Inputs and Selected Container • Validate Run Setup and Generate Sample Sheet

Protocol	Step	Automation
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)	• Update Lane Number • Set Next Steps Not used. By default, this functionality is determined by the Sequencer API. If necessary, you can enable the automation and use it to override the next step behavior used by the Sequencer API.

Configuration Details

The following sections describe the configuration installed with the Illumina NovaSeq 6000 Integration.

The Illumina NovaSeq 6000 Integration Package v3.2.2 supports Clarity LIMS v4.2 to v5.3). Clarity LIMS v5.4 and later is not supported.

As of Clarity LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface (the API resource is still called UDF). There are two types of custom fields:

- Master step fields—Configured on master steps. These fields only apply to the master step on which they are configured, and the steps derived from those master steps.
- Global fields—Configured on entities such as submitted sample, derived sample, measurement, etc. These fields apply to the whole Clarity LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.0.1)

This protocol sets the Loading Workflow Type and allows you to choose the appropriate Flowcell Type and Final Loading Concentration (pM). At the end of the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.0.1) or the NovaSeq Xp (NovaSeq 6000 v3.0.1) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v3.0.1), described in the following section.

Step 1. Define Run Format (NovaSeq 6000 v3.0.1)

Step input: NTP (normalized libraries)

Step output: None

The following automations are configured on this step:

- Routing Script
- Set Next Steps
- Define Run Format (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5

These automations are described in the order in which they are triggered at run time.

Set Next Steps

Automatically triggered on exit of the Record Details screen, this automation does the following actions:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, an empty value, not including 0), it generates an error message informing that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) { \
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares the Normalized Molarity value of each sample with the Minimum Molarity value. If the Normalized Molarity value is lower than the Minimum Molarity value, sets the Loading Workflow Type of the sample to Remove from workflow. The automation also records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::)
{ \
  input.::Warning:: = ::The Normalized Molarity is too low.:: ; \
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; } \
else { input.::Warning:: = ::n/a:: }
```

At this point, there are two options:

- Correct the Normalized Molarity value on the Record Details screen. Edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.0.1 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.0.1 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) step.

The default automation command line is as follows.

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l
{compoundOutputFileLuid0} script:changeWorkflow \\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.0.1' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.0.1' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Step UDFs/Custom Fields

There are four fields defined on the Define Run Format (NovaSeq 6000 v3.0.1) step.

The fields are shown in the Clarity LIMS v5 Configuration area (Custom Fields > Master Step Fields tab). See Table 3 for Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 201 Table 3: Define Run Format (NovaSeq 6000 v3.0.1) Step UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints	Preset Values/Additional Options and Drop-Down Items
Comment	Multiline Text	• Required: No • Read Only: No	Not applicable
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• SP • S1 • S2 • S4
Instruction	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• Default: Add Flowcell Type and Loading Workflow Type below.
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp

Global UDFs/Custom Fields

Table 4 lists the global UDFs/custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.0.1) step.

Table 202 Table 4: Global UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Adjusted Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Final Loading Concentration (pM)	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 225 • 400 • Decimal Places Displayed: 0
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • Remove from workflow
Minimum Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Normalized Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Per Sample Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Warning	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: Yes • Custom Entries: Yes	• The Normalized Molarity (nM) is too low. • Not applicable

User Interaction

1. On the Record Details screen, the Sample Details table contains the following fields that must be completed (values can vary across samples):
   - Loading Workflow Type: Select NovaSeq Standard or NovaSeq Xp from the drop-down list.

- Flowcell Type: Select SP, S1, S2, or S4 from the drop-down list.
- Final Loading Concentration (pM): Select from the two preset options—225 (for PCR-free workflows) or 400 (for Nano workflows)—or may enter a different value.
- Normalized Molarity (nM): These values are copied over from the previous step. If you did not populate this column during library prep, enter the values here.

2. Select Next Steps. This selection triggers the Next Steps automation, which does the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to successfully advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, an empty value, not including 0), it generates an error message saying that the field cannot be empty.
   - Compares the Normalized Molarity value of each sample with the Minimum Molarity value.
3. On the Assign Next Steps screen in the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

   For samples whose Normalized Molarity value is found to be lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is recorded in the Warning field for the sample.
   At this point, there are two options:
   - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. Also, set the Loading Workflow Type to NovaSeq Standard.
   - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
4. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow (ie, where Normalized Molarity value is lower than the Minimum Molarity) are removed from the Clarity LIMS workflow.
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step. This step is the first of two steps in the NovaSeq Standard (NovaSeq 6000 v3.0.1) protocol.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) step. This step is the first of three steps in the NovaSeq Xp (NovaSeq 6000 v3.0.1) protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0.1)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) protocol.

This protocol contains two steps:

- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.0.1)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)

In this step, place libraries into a single pool. Add resuspension buffer and reagents.

Only create one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
- Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5.

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation does the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created. Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
```

For Research Use Only. Not for use in diagnostic procedures.

```
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes

Automatically triggered when the Calculate Volumes button on the Record Details screen is selected, this automation does the following actions:

- Calculates the number of samples in the pool:

```
-exp 'step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: +
1'
```

- Sets the value of the Bulk Pool Volume (µl) field, based on the selected Flowcell Type:

```
-exp 'if ( input.::Flowcell Type:: == ::SP:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: *
100 + 30
} ;

if ( input.::Flowcell Type:: == ::S1:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: *
100 + 30
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: *
150 + 30
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Flowcells to Sequence:: *
310 + 30
} ;
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (µl):: ) / step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value is set at 5 and may be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

For Research Use Only. Not for use in diagnostic procedures.

1. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field of the sample.
2. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
-exp 'step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::'
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;output.::Loading Workflow
Type:: = input.::Loading Workflow Type:: ;
```

- Sets the Volume of Pool to Denature (µl) value and calculates NaOH Volume (µl) and Tris-HCl Volume (µl) values, based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(µl):: = 100 ; output.::NaOH Volume (µl):: = 25 ; output.::Tris-HCl Volume
(µl):: = 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(µl):: = 100 ; output.::NaOH Volume (µl):: = 25 ; output.::Tris-HCl Volume
(µl):: = 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) {output.::Volume of Pool to Denature
(µl):: = 150 ; output.::NaOH Volume (µl):: = 37.50 ; output.::Tris-HCl Volume
(µl):: = 37.50 } ;
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(µl):: = 310 ; output.::NaOH Volume (µl):: = 77.50 ; output.::Tris-HCl Volume
(µl):: = 77.50 }
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file. The generated file contains information about the pool and the samples it contains. It is available for download on the Step Setup screen of the following step—Dilute and Denature (NovaSeq 6000 v3.0.1).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
```

```
  -o 1.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
  -o 2.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
  -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation sets the next step for samples to ADVANCE. The samples advance to the next step in the protocol—Dilute and Denature (NovaSeq 6000 v3.0.1):

```
nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are five fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step.

These fields are shown in the Clarity LIMS v5 Configuration area (Custom Fields > Master Step Fields tab).

See Table 5 for Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 203 Table 5: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) Step UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Flowcells to Sequence	Numeric	• Required: Yes • Read Only: No	• Range: 1 to 10 • Decimal Places Displayed: 0

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 2
Minimum Per Sample Volume (µl)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0

Global UDFs/Custom Fields

The following table lists the global UDFs/custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
RSB Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Tris-HCl Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Volume of Pool to Denature (µl) Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step only. Displays on Record Details screen and in the generated CSV file.	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.
   b. Name the pool or accepts the default name (Pool #1).
   c. Select Record Details.

   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type and only one pool has been created.
4. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Flowcells to Sequence—The value entered in this field is used in volume calculations, to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—In many applications, and particularly where robotics are used, a minimum sample volume is required. The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value, 5 µl, but may be edited if necessary.

   In the Sample Details table, select the pool icon to view details on the pool composition.

For Research Use Only. Not for use in diagnostic procedures.

5. Select Calculate Volumes. This action triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
    - Calculates Bulk Pool Volume (µl) value.
    - Sets the value of the Bulk Pool Volume (µl) field, based on the selected Flowcell Type.
    - Calculates the Per Sample Volume (µl) value to be added to the pool.
    - Calculates the Total Sample Volume (µl) value.
    - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
    - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
    - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and T ris-HCl Volume (µl) columns of the Sample Details table. (Values are set by a script and are not editable.)
    - Generates the Calculation File (*.csv) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select the file to download it, then open it in Excel.
6. Select Next Steps to trigger the Set Next Step automation. This automation sets the next step for samples to ADVANCE. The samples advance to the next step in the protocol: Dilute and Denature (NovaSeq 6000 v3.0.1).
   On the Assign Next Steps screen, the next step is already set to Dilute and Denature (NovaSeq 6000 v3.0.1).
7. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.0.1) step.

Step 2: Dilute and Denature (NovaSeq 6000 v3.0.1)

In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB). Samples are manually placed by into the library tube that is used in the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Bulk pool

Step output: Library tube

The following automations are configured on the step:

- Routing Script
- Check Library Tube Barcode
- Validate Run Setup and Generate Sample Sheet
- Validate Single Input

- Dilute and Denature (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5

These automations are described in the order in which they are triggered at run time.

Validate Single Input

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Check Library Tube Barcode

Automatically triggered on exit of the Placement screen, this automation does the following actions:

- Validates the library tube barcode to make sure it conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}:

```
if (!output.container.name.matches(::[A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}::)) { fail
(::Invalid Library Tube Barcode. Please verify and try again.::) }
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; output.::Loading Workflow
Type:: = input.::Loading Workflow Type::'
```

Validate Run Setup and Generate Sample Sheet

Automatically triggered when a button on the Record Details screen is selected, this automation does the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. See*Respond to Validation/Recipe Request call from Instrument*.
  - The Experiment Name field may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, Index Read 1 must be zero. When Workflow Type = Single Index, Index Read 1 must be greater than zero, and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {fail(::Experiment
Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -,
and _::)};if (step.::Workflow Type:: ==
```

```
::No Index::) {if (step.::Index Read 1:: !=0 || step.::Index Read 2:: != 0)
{fail(::Index Read 1 and Index Read 2 must be 0 ifNo Index is selected.::)}}else
if (step.::Workflow Type:: == ::Single Index::) {if (step.::Index Read 1:: ==0)
{0 || step.::Index Read 2:: != 0) {fail(::Index Read 1 must be greater than 0
and Index Read must be 0 if Single Index is selected.::)}} else {if
(step.::Index Read 1:: == 0 || step.::Index Read 2:: == 0) {
fail(::Index Read 1 and Index Read 2 must be greater than 0 if Dual Index is
selected.::)}};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, generates an error.

```
if (step.::Paired End::.toBoolean() && step.::Read 2 Cycles:: == 0) {
  fail(::Read 2 Cycles must not be zero if it is Paired End read.::)
};
```

- Validate UMI Settings
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be greater than
0 if UMI - Read 1 Length is greater than 0.::) }; if (!step.hasValue(::UMI -
Read 1 Length::) && step.hasValue(::UMI - Read 1 Start From Cycle::)) { fail
(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From Cycle
is greater than 0.::) }; if (step.hasValue(::UMI - Read 2 Length::) &&
!step.hasValue(::UMI - Read 2 Start From Cycle::)) { fail(::UMI - Read 2 Start
From Cycle must be greater than 0 if UMI - Read 2 Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) { fail(::UMI - Read 2 Length must be greater than 0 if UMI
- Read 2 Start From Cycle is greater than 0.::) }; if (!step.hasValue(::UMI -
Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) { fail(::UMI - Read
1 Length must be greater than 0 if UMI - Read 2 Length is greater than 0.::) };
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) { fail(::UMI - Read 1 Start From Cycle must be
greater than 0 if UMI - Read 2 Start From Cycle is greater than 0.::) };
```

- Checks the Paired End and Read 2 Cycles field values.

For Research Use Only. Not for use in diagnostic procedures.

  - If Paired End = True and Read 2 Cycles value is 0, generates an error.
  - If Paired End = False, Read 2 Cycles must be zero, Reverse complement workflow must be false, and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) { if (step.::Read 1 Cycles:: == 0 ||
step.::Read 2 Cycles:: == 0) { fail(::Read 1 Cycles and Read 2 Cycles must be
greater than 0 if Paired End is True.::) } } else { if (step.::Read 2 Cycles::
!= 0) { fail(::Read 2 Cycles must be 0 if Paired End is False.::) }; if
(step.::Reverse Complement Workflow::.toBoolean()) { fail(::Reverse Complement
Workflow can only be enabled in a Paired End run.::) }; if (step.hasValue(::UMI
- Read 2
if (step.::Workflow Type:: == ::Dual Index:: && step.::Index Read 2:: == 0) {
  fail(::Index Read 2 must not be zero if Workflow Type is Dual Index.::)
};
if (step.::Workflow Type:: == ::No Index:: || step.::Workflow Type:: == ::Single
Index::) {
  step.::Index Read 2:: = 0
};
Length::) || step.hasValue(::UMI - Read 2 Start From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
}::
```

- Checks the Flowcell Type field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, it generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) { fail
(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
};if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) { fail
(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
```

- Sets the Settings Header if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? '[Settings]' : '';
```

- Sets the next step for samples to REMOVE.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step (see *Sample Sheet Generation* section).
  - Sample sheet template used depends on the selected value of Reverse Complement Workflow.

```
if [ '{udf:Reverse Complement Workflow}' == 'true' ]; then
\templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \elif
[ '{udf:Reverse Complement Workflow}' == 'false' ]; then
```

```
\templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \else echo 'UDF Reverse
Complement Workflow is empty or undefined.'; exit -1; fi \&&
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \   script:driver_file_generator \     -t
/opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename\   -o
{compoundOutputFileLuid0}.csv \     -q true \     -destLIMSID
{compoundOutputFileLuid0} \     -l{compoundOutputFileLuid1}"
```

```
UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2 Length::)) {
```

```
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)};if (!step.hasValue(::UMI - Read 1 Start From Cycle::) &&
step.hasValue(::UMI - Read 2 Start From Cycle::)) {fail(::UMI - Read 1 Start
From Cycle must be greater than 0 if UMI - Read 2 Start From Cycle is greater
than 0.::)};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, it generates an error.
  - If Paired End = False, Read 2 Cycles must be zero, Reverse Complement workflow must be false, and UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {if (step.::Read 1 Cycles:: == 0 ||
step.::Read 2 Cycles:: == 0) {fail(::Read 1 Cycles and Read 2 Cycles must be
greater than 0 if Paired End is True.::)}} else {if (step.::Read 2 Cycles:: !=
0) {fail(::Read 2 Cycles must be 0 if Paired End is False.::)};if
(step.::Reverse Complement Workflow::.toBoolean()) {fail(::Reverse Complement
Workflow can only be enabled in a Paired End run.::)};if (step.hasValue(::UMI -
Read 2 Length::) || step.hasValue(::UMI - Read 2 Start From Cycle::)) fail(::UMI
- Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined if Paired
End is False.::)
}}::
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, it generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {fail
(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)}if
(input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {fail(::Read 2
Cycles must not be larger than 151 if it is not SPrime Flowcell::)}
```

- Sets the Settings Header if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? '[Settings]' : '';
```

- Sets the next step for samples to REMOVE:

For Research Use Only. Not for use in diagnostic procedures.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step. (See the *Sample Sheet Generation* section.)
  - Sample sheet template used depends on the selected value of Reverse Complement Workflow.

```
&& if [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Routing Script

Automatically triggered on exit of the step, this automation invokes the change Workflow script, which routes step outputs to the NovaSeq 6000 v3.0.1 workflow. It also and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

The default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2}
script:changeWorkflow \
\
--FIELD_NAME 'N/A' \
--FIELD_VALUE 'N/A' \
--WORKFLOW 'NovaSeq 6000 v3.0.1' \
--STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)' \
--INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Step UDFs/Custom Fields

There are 22 fields defined on the Dilute and Denature (NovaSeq 6000 v3.0.1) step. These fields are required for sample sheet and JSON file generation.

The fields are shown in the Clarity LIMS v5 Configuration area (Custom Fields > Master Step Fields tab). See Table 7 for Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 204 Table 7: Dilute and Denature (NovaSeq 6000 v3.0.1) Step UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
BaseSpace Sequence Hub Configuration	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: No	Not applicable
Experiment Name	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Index Read 1	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Output Folder	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Paired End	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• True • False

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Read 1 Cycle	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Read 2 Cycle	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 *Value of 251 is only supported for SP flow cell type. For all other cell types, maximum value is 151.
Reverse Complement Workflow	Checkbox (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: Yes
Run Mode Not displayed in user interface)	Single-line Text (v4) Toggle Switch (v5)	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4
Sitting Header (not displayed in user interface)	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	Not applicable

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
UMI—Read 1 Length	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 1 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 2 Length	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
UMI—Read 2 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Custom Entries: Yes	Not applicable
Use Custom Index Read 1 Primer	Checkbox(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None set
Use Custom Read 1 Primer	Checkbox(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None set
Use Custom Read 2 Primer	Checkbox(v4) Toggle Switch (v5)	• Required: No • Custom Entries: No	• None set
Use Custom Recipe	Checkbox(v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: No
Workflow	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• GenerateFASTQ
Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Global UDFs/Custom Fields

Table 8 lists the global UDFs / custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.0.1) step.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Placement screen, complete the following actions:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.

   On exit of the Placement screen, the Check Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}. An error message displays if not.
2. On the Record Details screen:
   - The Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Select from the active lots displayed in each drop-down list.

     To make reagent lots available for selection in the Reagent Lot Tracking section, first configure and activate them. Do this step on the Reagents and Controls screen (Clarity LIMS v4.2.x) or the Configuration > Consumables screen (Clarity LIMS v5.x).

   - The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet file. Some of these fields are autopopulated and some must be completed manually (see Table 9, for details).

Table 205 Table 9: Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeq 6000 v3.0.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.

Field	Value
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage.
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, Custom.
Index Read 1	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, 51 - or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option was selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.

Field	Value
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enters the network path for sequencing run folder. For example: \\networkshare\run_data

3. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet.
   This selection triggers the automation script, which does the following:
   a. Validates the information provided to set up the run.
   b. Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Details screen.
   c. Sets the value of the next step to Remove from workflow. The Routing Script automation expects this value and requires it to successfully advance samples to the next step.
4. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

5. Select Finish Step.
   On exit from the step:
   - The Routing Script automation is triggered and samples are routed to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) protocol.
   - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step and data from the run is parsed back into Clarity LIMS.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0.1)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.0.1) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) protocol.

This protocol contains three steps:

For Research Use Only. Not for use in diagnostic procedures.

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)
- Step 2: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.0.1)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)

In this step, manually place libraries into a pool.

Only create one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation does the following actions:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as bulk pool.

```
/opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes

Automatically triggered when the Calculate Volumes button is selected on the Record Details screen, this automation does the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) field, based on the selected Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Lanes to Sequence:: * 18 +
30
} ;
if ( input.::Flowcell Type:: == ::S1:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Lanes to Sequence:: * 18 +
30
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Lanes to Sequence:: * 22 +
30
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
  step.::Bulk Pool Volume (µl):: = step.::Number of Lanes to Sequence:: * 30 +
30
} ;
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value, set at 5, may be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (µl) field.
2. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the following step: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1).

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are five fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) step.

These fields are shown in the Clarity LIMS v5 Configuration area (Custom Fields > Master Step Fields tab).

See the following table for Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 206 Table 10: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) Step UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Lanes to Sequence	Numeric	• Required: Yes • Read Only: No	• Decimal Places Displayed: 0
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0
Minimum Per Sample Volume (µl)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0

Global UDFs/Custom Fields

Table 11 lists the global UDFs/custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) step.

Table 207 Table 11: Global UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
RSB Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen:
   a. Drag samples into the Pool Creator to create a pool.
   b. Name the pool or accept the default name (Pool #1).
   c. Select Record Details.

   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool automation is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type and only one pool has been created.
4. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Lanes to Sequence—The value entered in this field is used in volume calculations, to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—In many applications, and particularly where robotics are used, a minimum sample volume is required. The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value, 5 µl, but may be edited if necessary.

   In the Sample Details table, select the pool icon to view details on the pool composition.
5. Select Calculate Volumes. This selection triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.

For Research Use Only. Not for use in diagnostic procedures.

- Calculates the Total Sample Volume (µl) value.
- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, then open it in Excel.

6. Select Next Steps. This selection triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1).
   On the Assign Next Steps screen, the next step is already set to Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1).
7. Select Finish Step. At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) step.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.0.1)

In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. Manually create working pools based on the number of lanes you want to sequence.

Step input: Bulk pool

Step output: Working pool - variable number, choose how many working pools to create per bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type
- Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools script. This script does the following:

- Checks the inputs to the step and validates that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and that all inputs have the same value for this field.
- Checks the container type selected matches the value in the Flowcell Type field.
- Validates that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message reveals that the number of working pools does not match the number of lanes available on the flow cell.

For Research Use Only. Not for use in diagnostic procedures.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1}"
```

Calculate Volumes

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields, based on the Flowcell Type:

- Bp Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)

```
'if ( input.::Flowcell Type:: == ::SP:: ) {
  output.::bp Aliquot Volume (µl):: = 18 ;
  output.::NaOH Volume (µl):: = 4.50 ;
  output.::Tris-HCl Volume (µl):: = 4.50 ;
  step.::DPX1 Volume (µl):: = 126 ;
  step.::DPX2 Volume (µl):: = 18 ;
  step.::DPX3 Volume (µl):: = 66 ;
  output.::Mastermix per Lane (µl):: = 63};
if (input.::Flowcell Type:: == ::S1::) {
  output.::bp Aliquot Volume (µl):: = 18;
  output.::NaOH Volume (µl):: = 4.50;
  output.::Tris-HCl Volume (µl):: = 4.50;
  step.::DPX1 Volume (µl):: = 126;
  step.::DPX2 Volume (µl):: = 18;
  step.::DPX3 Volume (µl):: = 66;
  output.::Mastermix per Lane (µl):: = 63};
if (input.::Flowcell Type:: == ::S2::) {
  output.::bp Aliquot Volume (µl):: = 22;
  output.::NaOH Volume (µl):: = 5.50;
  output.::Tris-HCl Volume (µl):: = 5.50;
```

```
  step.::DPX1 Volume (µl):: = 126;
  step.::DPX2 Volume (µl):: = 18;
  step.::DPX3 Volume (µl):: = 66;
  output.::Mastermix per Lane (µl):: = 77};
if (input.::Flowcell Type:: == ::S4::) {
  output.::bp Aliquot Volume (µl):: = 30;
  output.::NaOH Volume (µl):: = 7.50;
  output.::Tris-HCl Volume (µl):: = 7.50;
  step.::DPX1 Volume (µl):: = 315;
  step.::DPX2 Volume (µl):: = 45;
  step.::DPX3 Volume (µl):: = 165;
  output.::Mastermix per Lane (µl):: = 105
};
```

The automation also does the following actions:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file. The file contains information about the DPX volume and the volume of bp Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the following step: Load to Flowcell (NovaSeq 6000 v3.0.1).

```
and /opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar \
 -i {stepURI:v2} \
 -u {username} \
 -p {password} \
 -l {compoundOutputFileLuid1} \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
 -o {compoundOutputFileLuid0}.csv \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
 -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation does the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Step UDFs/custom fields

There are three fields defined on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0) step. These field values are set by a script and are not editable while running the step.

The fields are shown in the Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

Table 12 lists Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Table 208 Table 12: Dilute, Denature, and ExAmp (NovaSeq v3.0.1) Step UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
DPX1 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX2 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX3 Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Global UDFs/Custom Fields

Table 209 Table 13: Global UDFs/Custom Fields on the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) Step

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Bp Aliquot Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
NaOH Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (µl)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

User Interaction

1. On the Queue screen, add the pool to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, (optionally) set the number of derivatives to create. Place them into the flow cell lanes and select Begin Work.
   On entry to the Record Details screen, the Calculate Volumes automation is triggered. This automation sets the following values based on the selected Flowcell Type (calculation details are provided in the previous *Calculate Volumes* section):
   - Bp Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)

   Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.

Generates the Calculation File (*csv) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool. Select the file to download it, then open it in Excel.

3. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, RSB, and Tris-HCl reagent lots. Select from the active lots displayed in each drop-down list.

   > To make reagent lots available for selection in the Reagent Lot Tracking section, first configure and activate them. Do this step on the Reagents and Controls screen (Clarity LIMS v4) or the Configuration > Consumables screen (Clarity LIMS v5).

   In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. (These values are set by a script and are not editable.)
4. In the Sample Details table, select the pool icon to view details on the working pool composition.
   - The bp Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are already populated. (These values are set by a script and are not editable.)
   - The working pool number is appended to the bulk pool name. This feature allows you to quickly identify which working pools are derived from the same bulk pool.
5. In the Files area, select the Calculation File (*csv) file to download it and then open it in Excel to view information about the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool.
6. Select Next Steps to trigger the Set Next Step automation (described previously).
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.0.1).
7. Select Finish Step.

Step 3: Load to Flowcell (NovaSeq 6000 v3.0.1)

In this step, scan the flow cell barcode into Clarity LIMS, then manually place the working pools into the lanes of the flow cell that are used in the NovaSeq run. In addition, this step validates the run setup information and generates the sample sheet file.

Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)

The following automations are configured on the step:

- Validate Run Setup and Generate Sample Sheet
- Validate Flowcell Barcode
- Validate Inputs and Selected Container
- Load to Flowcell (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5

These automations are described in the order in which they are triggered at run time.

Validate Inputs and Selected Container

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected, as follows.

- Check that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4), and that all inputs have the same value.
- Check that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message says that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Check that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode

Automatically triggered on exit of the Placement screen, this automation:

Validates the flow cell barcode scanned into Clarity LIMS, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-
Za-z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
```

```
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-Za-z0-9]{5}DMXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Za-z0-9]{5}DSXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ;
```

Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; \
output.::Loading Workflow Type:: = input.::Loading Workflow Type::'
```

Validate Run Setup and Generate Sample Sheet

Automatically triggered when a button on the Record Details screen is selected, this automation does the following actions:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which is used to set up the run and generate the sample sheet file. (See*Respond to Validation/Recipe Request Call from Instrument* on page 768 section.)
  - The Experiment Name field may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, both Index Read 1 and Index Read 2 must be zero.
  - When Workflow Type = Single Index, Index Read 1 must be greater than zero and Index Read 2 must be zero.
  - When Workflow Type = Dual Index, both Index Read 1 and Index Read 2 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { \
  fail(::Experiment Name contains prohibited characters. Allowed characters are: a-z, A-Z, 0-9, -, and _::) \
}; \
if(step.::Workflow Type::== ::No Index::) { \
  if(step.::Index Read 1::!= 0) { \
    fail(::Index Read 1 must be 0 if the Workflow Type is No Index.::) \
  } \
} else { \
  if(step.::Index Read 1::== 0) { \
```

For Research Use Only. Not for use in diagnostic procedures.

```
    fail(::Index Read 1 must be greater than 0 if the Workflow Type is ::+
step.::Workflow Type::+ ::.::) \
  } \
};
```

- Validate UMI Settings:
  - If UMI - Read 1 Length has value, then UMI - Read 1 Start From Cycle must have value.
  - If UMI - Read 1 Length has no value, then UMI - Read 1 Start From Cycle must not have value.
  - If UMI - Read 2 Length has value, then UMI - Read 2 Start From Cycle must have value.
  - If UMI - Read 2 Length has no value, then UMI - Read 2 Start From Cycle must not have value.
  - If UMI - Read 1 Length has not value, then UMI - Read 2 Length must not have value.
  - If UMI - Read 1 Start From Cycle has no value, then UMI - Read 2 Start From Cycle must not have value.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::)
};
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::)
};
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::)
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, an error message is generated.
  - If Paired End = False, Read 2 Cycles must be zero and the Reverse Complement workflow must be false. UMI - Read 2 Length and UMI - Read 2 Start From Cycle must be empty.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::)
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::)
};
if (step.::Reverse Complement Workflow::.toBoolean()) {
fail(::Reverse Complement Workflow can only be enabled in a Paired End run.::)
};
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::)
}
}::
```

- Checks the Flowcell field value.
  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, an error message is generated.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
if (input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime Flowcell::)
}
```

- Sets the Settings Header if UMI - Read 1 Length or UMI - Read 2 Length have value.

```
step.::Settings Header:: = step.hasValue(::UMI - Read 1 Length::) ||
step.hasValue(::UMI - Read 2 Length::) ? '[Settings]' : '';
```

For Research Use Only. Not for use in diagnostic procedures.

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - AUTOMATED - Run (NovaSeq 6000) v3.0.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and attaches it to the step. (See the *Sample Sheet Generation* section.)
- Sample sheet template used depends on the selected value for the Reverse Complete Workflow.

```
&& if [ '{udf:Reverse Complement Workflow}' == 'true' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Reverse_Complement_Samplesheet.csv'; \
elif [ '{udf:Reverse Complement Workflow}' == 'false' ]; then \
templateFilename='NovaSeq_BCL2FASTQ_Samplesheet.csv'; \
else echo 'UDF Reverse Complement Workflow is empty or undefined.'; exit -1; fi
\
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p
{password} \
script:driver_file_generator \
-t /opt/gls/clarity/extensions/conf/driverfiletemplates/$templateFilename \
-o {compoundOutputFileLuid0}.csv \
-q true \
-destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Step UDFs/Custom Fields

There are 23 fields defined on the Load to Flowcell (NovaSeq 6000 v3.0.1) step.

These fields are shown in the Clarity LIMS v5 Configuration area (Custom Fields > Master Step Fields tab). See Table 14 for Clarity LIMS v4 and Clarity LIMS v5 field configuration details.

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Single-line Text (v4) Text (v5)	• Required: No • Read Only: No	Not applicable

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Experiment Name	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Index Read 1	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Library Tube Barcode	Single-line Text (v4) Text (v5)	• Required: Yes • Read Only: No	Not applicable
Paired Ends	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• True • False

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Read 1 Cycles	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• *251 • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 • *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Read 2 Cycles	Numeric (v4) Numeric Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: Yes	• *251 • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 • *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151
Reverse Complement Workflow	Checkbox (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	• Default: Yes

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Run Mode (not displayed in user interface)	Single-line Text (v4) Text Dropdown (v5)	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4
Setting Header (not displayed in user interface)	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 1 Length	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 1 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 2 Length	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
UMI—Read 2 Start From Cycle	Numeric (v4) Numeric (v5)	• Required: No • Read Only: Yes	Not applicable
Use Custom Index Read 1 Primer	Checkbox (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Read 1 Primer	Checkbox (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Read 2 Primer	Checkbox (v4) Toggle Switch (v5)	• Required: No • Read Only: No	• None Set
Use Custom Recipe	Checkbox (v4) Toggle Switch (v5)	• Required: Yes • Read Only: No	Default: No
Workflow	Single-line Text (v4) Text (v5)	• Required: No • Read Only: Yes	• GenerateFASTQ
Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Global UDFs/Custom Fields

Table 15 lists the global UDFs/custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.0.1) step.

Table 210 Table 15: Global UDF/Custom Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in Clarity LIMS v4 and Derived Sample in Clarity LIMS v5:			
Flowcell Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4) Text Dropdown (v5)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Ice Bucket screen:
   a. Select the appropriate flow cell type from the Destination Container drop-down list in the Container Options panel.
   b. Select Begin Work.
2. On the Placement screen:
   a. Drag the pool (or pools) from the left of the screen over into the Placed Samples area on the right.
   b. Scan or types the barcode of the flow cell into the flow cell field.
   c. Select Record Details.

   On exit of the Placement screen, the Validate Flowcell Barcode automation validates the container barcode (described previously).
3. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet file. Some of these fields are autopopulated. Manually complete fields as needed (see Table 16 for more details).

Table 211 Table 16: Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v3.0.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage.
Workflow	Automatically populated with preset—GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, Custom.
Index Read 1	Select from preset options: 0, 6, 8—or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, 8—or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, 51—or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, 51—or type a value between 1 and 251. Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If Use Custom Recipe selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.

Field	Value
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Output Folder	Enter the network path for sequencing run folder. For example: \\networkshare\run_data
Library Tube Barcode	Scan the library tube barcode.

4. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet.
   This selection triggers the automation script, which does the following actions:
   - Validates the information provided to set up the run.
   - Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Details screen.
5. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for all samples is prepopulated with Mark protocol as complete.
6. Select Finish Step.
   In Lab View, the pooled samples are queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step and data from the run is parsed back into Clarity LIMS.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)

This final protocol contains one fully automated step, AUTOMATED- NovaSeq Run (NovaSeq 6000 v3.0.1).

This step is fully automated. Do not add samples to the Ice Bucket or start the step manually.

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol

Step output: Result file/measurement

Do not start this step. This step is fully automated, and the sequencing service does not update samples correctly if they have been manually started.

In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in Clarity LIMS.

Automated - NovaSeq Run (NovaSeq 600 v3.0.1) step contains two automations:

- Set Next Steps
- Update Lane Number

The Set Next Steps automation is the only automation configured on this step. By default, this automation is disabled (set to Not Used) and the Sequencer API is used to set the next step for samples.

AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) automation configuration - Clarity LIMS v5.

Set Next Steps

If necessary, override the default next step behavior used by the Sequencer API. To do this override, follow these steps:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation sets the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to be triggered automatically on exit of the Record Details screen.

Update Lane Number

This automation is triggered automatically upon entry to the Record Details screen.

Do not disable or modify this automation to ensure the Lane Number displays properly.

Step UDFs/Custom Fields

Table 17 shows how the run parameters parsed from the `RunParameter.xml` file map to step UDFs/custom fields configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step in Clarity LIMS.

Table 212 Table 17: Step UDFs/Custom Fields

Step UDF/Custom Field Name
Current Cycle
Current Read
Firmware Version
Flow Cell Expiration Date
Flow Cell ID
Flow Cell Lot Number
Flow Cell Mode

Step UDF/Custom Field Name
Flow Cell Part Number
Flow Cell Side
Instrument Control Software Version
Instrument ID
Instrument Type
Lane Counter
Loading Workflow Type
Output Folder
RTA Version
Run ID
Run Status
Sequencing Log

Global UDFs/Custom Fields

The following global UDFs/custom fields are used to capture the run metrics in Clarity LIMS.

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2

- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following information:

- Values are aggregated across all lanes. Some values—for example Yield PF (Gb) R1—are summed, while others are averaged.
- The names listed previously are the default UDF/global field names installed with the NovaSeq Integration v3.2.2 configuration provided in the Preconfigured Workflow Package (PCWP) v1.2.2 or later.
- All UDFs/global fields are configured on the Container entity.
- All field names are configurable via the Clarity LIMS Configuration > Custom Fields screen (Global Fields tab).
- If the field names in Clarity LIMS are changed, also change them through the `run.metricUdfNames` properties file in the `application.yml` file for the Sequencer API (see *application.yml Properties* on page 773). All fields are configured to be visible on the Record Details screen of the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step, in the Sample Details table.
  - As these UDFs/fields are configured on the Container entity, they are visible on each input. However, they should not be confused with per-lane metrics.
  - All run metrics tracked in Clarity LIMS are overall metrics for the run. There are no per-lane metrics provided by NovaSeq Control Software currently.

How the Sequencer API Integration Works

Sample Sheet Generation

The sample sheet is generated on the step before the run – Dilute and Denature (NovaSeq 6000 v3.0.1) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.0.1) in the NovaSeq Xp protocol. This step is where samples are placed on the library tube or flow cell that is loaded in the NovaSeq instrument.

In the default configuration, the *Validate Run Setup and Generate Sample Sheet* on page 754 automation generates one CSV format sample sheet file for use with bcl2fastq v2.20 downstream analysis.

How it Works

The sample sheet is uploaded to the NVCS via the /Illumina/Sequencer/v2/sequencing-run/files endpoint to the Sequencer API. The files endpoint allows for a file to be downloaded from Clarity LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Contents

The sample sheet content is controlled by the following step UDFs/master step fields that display in the Step Details area of the Record Details screen (see Table 1 and Table 3).

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow
- Reverse Complement Workflow

See the *Bcl2fastq2 Sample Sheet Generation* article for detailed information on the following:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq Run

The following steps outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq instrument.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at /Illumina/Sequencer/v2/sequencing-run/login). This endpoint returns the URL that the instrument uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the Clarity LIMS login screen and the NVCS displays this screen. When you log in, this action automatically authorizes the NVCS to use the account to access Clarity LIMS.
2. Enter credentials.
   - Username and password are passed to the Clarity LIMS server, to ensure that the access is valid.
   - By default, the Sequencer API service tries to contact Clarity LIMS at http://localhost:9080/clarity/. This URL is set by the installation script, but it can be configured with the `clarity.url` property in the `application.yml` file. See *application.yml Properties* on page 773.
3. User is redirected to the instrument login page at /Illumina/Sequencer/v2/sequencer_login.

For Research Use Only. Not for use in diagnostic procedures.

- If authentication is successful, the screen displays a success message. The Clarity LIMS server provides the OAuth token and username by returning them in redirect to /Illumina/Sequencer/v2/sequencer_login/Success. This redirect does not reload the page, but it allows the NovaSeq to continue with run setup.
- If authentication fails, you are left on the login screen and a warning message informs them of the failure. A background redirect to /Illumina/Sequencer/v2/sequencer_login/Error informs the NovaSeq of the failure.

Respond to Validation/Recipe Request Call from Instrument

1. The sequencing-run/recipe/novaseq endpoint consumes a POST request with a LibraryContainerI, FlowCellId, and reagents information.
   - LibraryContainerId, FlowCellId, and reagents information are provided by the NovaSeq. LibraryContainerId is required.
   - LibraryContainerId and FlowCellId should match either the library tube ID or flow cell ID of the corresponding containers in Clarity LIMS.
   - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows:
   - All samples in the container must be queued for a sequencing run step.
   - All samples must be queued for only one sequencing run step.
   - All samples must be queued for the same sequencing run step.

> You can configure the steps that are considered as 'sequencing run steps' in the novaseq.sequenceStepNames property in the application.yml file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. See *application.yml Properties* on page 773.

3. After a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API and the run recipe is generated.
   - The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
   - By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.0.1) or Load to Flowcell (NovaSeq 6000 v3.0.1) step, depending on workflow.
   - The default field values match the names of the fields in the NovaSeq v3.2.1 configuration included in PCWP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to an entry in the recipe and the value of a property defines the name of the field that is used to populate that entry in the recipe.
   - It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.

For Research Use Only. Not for use in diagnostic procedures.

- The Clarity LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the application.yml. See*application.yml Properties* on page 773. If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

4. After the recipe is generated, it is returned as a JSON file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The contents of the run recipe are controlled by the sample sheet contents and the step UDFs/master step fields, configured on the Dilute and Denature (NovaSeq 6000 v3.0.1) and Load to Flowcell (NovaSeq 6000 v3.0.1) steps.

Example of run recipe content is as follows.

```
{
  "run_name": "NVCS16027_SPrime_2x250",
  "run_mode": "S4",
  "workflow_type": "DualIndex",
  "librarytube_id": "NV0025867-LIB",
  "flowcell_id": "",
  "sample_loading_type": "NovaSeqStandard",
  "rehyb": false,
  "paired_end": true,
  "read1": 151,
  "read2": 151,
  "index_read1": 8,
  "index_read2": 8,
  "output_folder": "\\\\network_path\\run_data",
  "samplesheet": "<path to sample sheet on LIMS server>",
  "require_samplesheet_authentication": true,
  "usecustomrecipe": false,
  "customRecipe": null,
  "use_basespace": false,
  "basespace_mode": null,
  "use_custom_read1_primer": false,
  "use_custom_read2_primer": false,
  "use_custom_index_read1_primer": false
}
```

For Dilute and Denature (NovaSeq 6000 v3.0.1) step field configuration details, see Table 7. To see how these fields are populated on the Record Details screen at run time, see Table 9.

For Load to Flowcell (NovaSeq 6000 v3.0.1) step field configuration details, see Table 14. To see how these fields are populated on the Record Details screen at run time, see Table 16.

Respond to Sequencing Started Call from Instrument

Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

An error is thrown and the step is not started if no matching container is found, or if the samples in the container are incorrectly queued. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

1. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
   - If a kit is configured for the API but does not exist in Clarity LIMS, it is created.
   - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it.
     - If a kit that is to be enabled is Archived, it is set to Active.
     - If a kit that is to be enabled is in Pending status, it is set to Active.
   - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged and the step is unable to be completed by the API without user intervention.
   - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored and a warning is logged during lot tracking.

   The number of replicates for the step is determined by the type of flow cell being used in the run.
   - For Standard mode, this number is based on the number of lanes in the flow cell (this is stored as part of the Sequencer API configuration).
   - For XP mode, this number is always one replicate, because there is already one input tracked for each lane.
2. The automated sequencing step is started.
3. Reagent lots are attached to the step.
   - The Flow Cell and Library Tube reagents in the request are ignored. Information from these reagents are tracked in Clarity LIMS as containers and UDFs.
   - Any other reagents in the request are handled as follows:
     - If the reagent is not configured to be tracked, a warning is logged and the reagent is ignored.
     - Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
     - If one or more matching reagent lots exists in Clarity LIMS, the newest one is used:

- If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.

- Otherwise a new lot is created with:
  - Reagent Kit—Matching kit as determined from Sequencer API configuration and previous step
  - Name—Serial number in request
  - Lot Number—Lot number in request
  - Expiry—Expiry date in request
  - Status—Active

  If any reagents were expected to be in the request but were not, these reagents are logged. This action prevents the step from being completed without user intervention.

4. Step UDFs/master step fields are updated with the run information parsed from the request. See *Respond to Record InterOps Metrics Call from Instrument* on page 771.
5. Any important events during this request are logged into the Sequencer API log file and in the Sequencing Log multiline UDF/field on the step (assuming the step was started successfully). See *Respond to Record InterOps Metrics Call from Instrument* on page 771.

Respond to Record InterOps Metrics Call from Instrument

When the metrics endpoint receives a POST, it does as follows.

Looks for a matching library tube or flow cell in Clarity LIMS.

Finds the in progress sequencing step for that container.

When the step is found, the run metrics in the request are written to container UDFs/global fields in Clarity LIMS.

Respond to Sequencing Completed Call from Instrument

If the sequencing run was successful, after the metrics have been recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following steps occur in Clarity LIMS:

1. The Current Cycle, Current Read, and Status UDFs/Master Step fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A success message is recorded in the log file, at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. Clarity LIMS waits for any automations that are triggered automatically as it advances the step.
5. By default, Clarity LIMS assigns the next steps on the outputs to move them on to the first configured next step. Or, if there are no next steps, to complete the protocol.

For Research Use Only. Not for use in diagnostic procedures.

Respond to Sequencing Errored Call from Instrument

If the sequencing run was unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status UDFs/Master Step fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A failure message is recorded in the log file, at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Instrument

If the sequencing run is ended, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in Clarity LIMS:

1. The Current Cycle, Current Read, and Status UDFs/Master Step fields are updated.
2. The multiline Sequencing Log UDF/Master Step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed with this Integration

The following sections describe the various components that are installed by default as part of this integration. These components include files, properties, reagent categories/label groups, reagent kits, and containers. Information on installed workflows, protocols, steps, and automation points is provided in the Workflows, Protocols, and Steps section.

Illumina NovaSeq Integration v3.2.2 is distributed as an RPM package: BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the Clarity LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following items:

- Sequencer API WAR file
- Configuration file: `application.yml`
- Two configuration scripts: `configure_sequencer_api_proxy.sh` and `configure_sequencer_api_application.sh`

The NovaSeq v3 configuration is delivered through the Preconfigured Workflows Package (PCWP) v1.2.2, which requires installation of the NGS Extensions Package v5.18 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.18 is installed, the latest version is installed by default with the NovaSeq integration. See Release Notes for details.
- If NGS Extensions Package v5.18 or later is already installed, the upgrade is not forced or required.

The RPM package installs the components listed in Table 18.

Table 213 Table 18: Illumina NovaSeq 6000 Integration RPM Components

Files Installed	Location and Description
Illumina#Sequencer#v2.war	/opt/gls/clarity/tomcat/current/webapps War file for NovaSeq v3.2.2 API
configure_sequencer_api_application.sh	/opt/gls/clarity/config/ Script that configures the Sequencer API application through its external application.yml file
configure_sequencer_api_proxy.sh	/opt/gls/clarity/config/ Script that configures the proxy to allow communication with the Sequencer API (NovaSeq v3.2.2 API) application
sequencer-api.conf	/etc/httpd/clarity/ proxy setting to communicate with Clarity LIMS

application.yml Properties

The `application.yml` file is located at opt/gls/clarity/extensions/sequencing-api/.

- All properties are configured automatically during installation, but you can also configure them by editing the `application.yml` file and then restarting Tomcat.
- All custom field names, both for recipe and run information, are represented by properties in the file.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, you can change Loading Workflow Type but you cannot change recipe.udfNames.sampleLoadingType.

Table 19 lists the properties it contains.

Table 214 Table 19: application.yml Properties Installed

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: tomcat (Do not change the default value)
clarity.url	Base URL that the Sequencer API service uses to contact Clarity LIMS. The installation script (configure_ sequencer_api_application) prompts for this property.

Property	Description
clarity.username	Username to be used when communicating with Clarity LIMS.
clarity.password	Encrypted password to be used when communicating with Clarity LIMS.
security.signing-key	Private key that should be used when signing/validating OAuth tokens. Changing this property invalidates any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration may find samples queued. • Names must be an exact match to the name of the step in Clarity LIMS(not the master step/process type). • Each line should be indented to the same point and start with a dash (-). Default value: • AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)
novaseq.flowcells	List of supported NovaSeq flow cell types. • Type names exactly match the values used by the NVCS run status requests. • To add more types, provide both type and lanes properties indented to the same point and starting with a dash (-). Default value: `- type: "SP"lanes: 2- type: "S1"lanes: 2- type: "S2"lanes: 2- type: "S4"lanes: 4`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps. • lotName—The name of the lot as it appears in the run started request. • kitName—The name of the corresponding reagent kit in Clarity LIMS that the lot should be tracked as. The name may differ in the NVCS request vs. the Clarity LIMS configuration. Default value: `- lotName: "Buffer"kitName: "Buffer Cartridge"- lotName: "Cluster"kitName: "Cluster Cartridge"- lotName: "SBS"kitName: "SBS Cartridge"`
recipe.udfNames	Configures the names of the UDFs/fields that are used in the run recipe (see *Run Recipe Contents* on page 769 for more information). • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.
run.stepUdfNames	Configures the step UDF/master step field names that are used when recording run results (see *Step UDFs/Custom Fields* on page 764 for more information). • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample share a name.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.metricUdfNames	Configures the result file UDFs/measurement global fields names that are used when recording run results. These fields capture the run data (see *Global UDFs/Custom Fields* on page 765 for more information).
run.autoComplete	Determines whether the sequencing run step should be completed automatically after parsing the run metrics on a run (see also run.autoCompleteOnlyAtSuccess). Default value: true See *Configuring autoComplete Properties* on page 777.
run.autoCompleteOnlyAtSuccess	Determines whether the sequencing run step should be: • Autocompleted when the run status is RunCompletedSuccessfully (ifautoCompleteOnlyAtSuccess is true) - or - • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true See *Configuring autoComplete Properties* on page 777.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1

For Research Use Only. Not for use in diagnostic procedures.

- S2
- S4

This integration supports:

- Library tube with barcode provided in the following format:
  - [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}
  - Example: AB1234567-XYZ
- SP, S1, S2, or S4 flow cell, with barcode provided in one of the following formats:
  - SP and S1 flow cell: [A-Za-z0-9]{5}DRX[XY2357]
  - S2 flowcell: [A-Za-z0-9]{5}DMX[XY2357]
  - S4 flow cell: [A-Za-z0-9]{5}DSX[XY2357]
  - Example: H1991DMXX

NVCS Configuration

For details on configuring NVCS for integration with Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

- On the steps that use the routing script Define Run Format (NovaSeq 6000 v3.0.1) and Dilute and Denature (NovaSeq 6000 v3.0.1), the Next Step for all samples must be set to Remove from workflow. This value is set by a script. Do not change this value in the Assign Next Steps screen.
- In Clarity LIMS v5, the following settings are required and must not be changed on the protocol configuration screen:
  - In the Next Steps section for the last step in the protocol, the method of assigning the next step must be set to Automatic.
- In Clarity LIMS v4, the following setting in the protocol configuration area is required and must not be changed for any protocol steps on which the Routing Script automation is configured:
  - On the Next Steps configuration tab, the Next Steps are set by a script toggle switch must be set to Yes.

Configuring autoComplete Properties

As of NovaSeq Integration v3.2.2, the `application.yml` configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow—AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)—is automatically completed:

- Only when the run status is RunCompletedSuccessfully (default behavior)

  -or -

- Regardless of the run status

By default, both properties are set to true and the step only completes if the run is successful. If the run fails or is aborted, manually complete the step in Clarity LIMS.

To autocomplete the step regardless of the result of the sequencing run, change the autoCompleteOnlyAtSuccess property value to false.

Enabling/Disabling autoComplete Properties

1. Open the `application.yml` file located at /opt/gls/clarity/extensions/sequencer-api/application.yml:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccess property as required.
3. Save the file.

Table 20 shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the autocomplete behavior of the sequencing step.

Table 215 Table 20: run.autoComplete and run.autoCompleteOnlyAtSuccess Value Matrix

run.autoComplete Property Value	run.autoCompleteOnlyAtSuccess Property Value	Outcome
True (default)	True (default)	• Step autocompletes only if sequencing run is successful. • If run is not successful, step does not autocomplete and run details are recorded in Clarity LIMS.
True	False	• Step autocompletes, regardless of the run status.
False	True	• Step does not autocomplete. • Run details are recorded in Clarity LIMS.
False	False	

For Research Use Only. Not for use in diagnostic procedures.

Rules and Constraints

- The workflow configuration contains several validation checks. To make that the calculations work properly, it is important not to disable any of this validation logic. The validation checks determine:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples. All other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the *Bcl2fastq2 Sample Sheet Generation* article.
- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step. This step is fully automated and the sequencing service does not update samples correctly if they have been manually started.
- For the automated run to start successfully, the Validate Run Setup and Generate Sample Sheet button must be selected.

Resources

- *NovaSeq 6000 Sequencing System Guide*

NovaSeq 6000 Integration v3.2.2 Validation and Troubleshooting

This guide explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.2.2.

The validation process involves:

- Running samples through the Library Prep Validation v1.0.1 workflow.
  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries are advanced to the workflow selected.
- Running normalized libraries through the NovaSeq 6000 v3.0.1 workflow. This action validates the following:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.0.1) step to the NovaSeq Standard (NovaSeq 6000 v3.0.1) or NovaSeq Xp (NovaSeq 6000 v3.0.1) step.
  - Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file is automatically uploaded to the sequencing instrument via the Sequencer API.

- Automatic validation of run setup information. This information is uploaded to the NovaSeq Control Software (NVCS) via the Sequencer API and is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into Clarity LIMS, via the Sequencer API.

Before running the validation steps below, these steps assume that you have installed the Illumina NovaSeq 6000 Integration Package v3.2.2 and have imported the default Clarity LIMS configuration.

Validation Steps

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the Library Prep Validation v1.0.1 and NovaSeq 6000 v3.0.1 workflows.

Step 1: Activate the Workflow

In the Clarity LIMS configuration area, activate the Library Prep Validation v1.0 and NovaSeq 6000 v3.0 workflows.

Step 2: Create a Project, Add Samples

1. On the Projects and Samples screen, create a project and add samples to it.
2. Assign your samples to the Library Prep Validation v1.0 workflow.

Library Prep Protocol: Library Prep Validation v1.0.1

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.0.1 workflow.

Step 1: Run Library Prep Validation v1.0.1

1. In Lab View, locate the Library Prep Validation v1.0.1 protocol. The Library Prep Validation v1.0.1 step opens.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen:
   a. In the Placed Samples area on the right in the container field, scan or enter the barcode of the destination container.
   b. Select the samples from the Samples to be Placed area on the left side, then drag them to the container wells on the right side.

For Research Use Only. Not for use in diagnostic procedures.

c. Select Add Labels.

5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. This label group is the only one configured in the out-of-the-box integration. It is used by default in this step.
   a. Select labels on the left side, and drag them to the container on the right side to assign them to placed samples.
   b. Select Record Details.
6. On the Record Details screen:
   a. In the Sample Details table, enter values for Normalized Molarity. Type values individually or use the Copy/Paste functionality to enter multiple values from a spreadsheet.
   b. The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.
   c. Populate the fields in this column using one of the following methods:
      - To populate fields individually for each sample, select from the drop-down list in each row.
      - To populate fields all at one time, use the Copy/Paste functionality to enter multiple values from a spreadsheet.

   Alternatively, select inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Select Apply.

   If you are working with many samples, you can use Copy/Paste functionality to enter multiple values from a spreadsheet.

   a. Select Copy Samples to copy the sample information from Clarity LIMS.
   b. Open a blank Excel document and paste the sample information into the spreadsheet.
   c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet, including the headers (Ctrl + A), and copy (Ctrl + C) the information.
   d. In Clarity LIMS, select Paste Samples. Paste the information (Ctrl + V) into the Update Table window, then select Update to paste into the Sample Details table.
7. Select Next Steps.
   This selection triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
8. On the Assign Next Steps screen in the Samples table, the Next Step for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

9. Select Finish Step.

For Research Use Only. Not for use in diagnostic procedures.

On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.0.1 workflow - Define Run Format (NovaSeq 6000 v3.0.1). This step is the only step in Protocol 1: Run Format (NovaSeq 6000 v3.0.1).

Protocol 1: Run Format (NovaSeq 6000 v3.0.1)

This protocol includes a single step: Define Run Format (NovaSeq 6000 v3.0.1). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v3.0.1)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.0.1) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v3.0.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options - 225 (for PCR-free workflows) or 400 (for Nano workflows), or you may enter a different value.
   - Normalized Molarity (nM)—These values are copied over from the previous step. If this column is not populated during library prep, enter the values here.
5. Select Next Steps. This selection triggers the Next Steps automation, which does the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (ie, an empty value, not including 0), it generates an error message stating that the field cannot be empty.
   - Compares each the Normalized Molarity value of each sample with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow, regardless of the Loading Workflow Type.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

- For samples whose Normalized Molarity value was found to be lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow. A message is also recorded in the Warning field for the sample.
  At this point you have two options:
  - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. Set the Loading Workflow Type to NovaSeq Standard or NovaSeq Xp, as applicable.
  - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.

7. Select Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow (ie, Normalized Molarity value is lower than the Minimum Molarity) are removed from the Clarity LIMS workflow.
   - Samples whose Loading Workflow Type is NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step. This step is the first of two steps in *Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0.1)* on page 783.
   - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step. This step is the first of three steps in *Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0.1)* on page 788.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0.1)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)
2. Dilute and Denature (NovaSeq 6000 v3.0.1)

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0.1) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0.1) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Type a name for the pool or accept the default name (Pool #1).

c. Select Record Details.

On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks the following details:

- All samples in the pool have been assigned the same Flowcell Type.
- Only one pool has been created.

5. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Flowcells to Sequence—This value is used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—This value is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl). The value may be edited if needed.

   Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
   a. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
   b. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes. This selection triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Sets the value of the Bulk Pool Volume (µl) field, based on the selected Flowcell Type.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. Values are set by a script and are not editable.
   - The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select the file to download it and then open it in Excel.
8. Select Next Steps. This selection triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE and advances them to the next step in the protocol: Dilute and Denature (NovaSeq 6000 v3.0.1).

   On the Assign Next Steps screen, the next step for samples is already set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.0.1).

For Research Use Only. Not for use in diagnostic procedures.

9. Select Finish Step.

At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.0.1) step.

Step 2: Run Dilute and Denature (NovaSeq 6000 v3.0.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0.1) protocol. The samples are queued for the Dilute and Denature (NovaSeq 6000 v3.0.1) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work. The Validate Single Input automation is triggered. This automation checks that there is only one container input to the step.
4. On the Placement screen:
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or type the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   On exit of the Placement screen, the Validate Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}. If not, an error message is displayed. This automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
      - Clarity LIMS v5: Navigate to the Consumables configuration screen.
      - Clarity LIMS v4: Navigate to the Reagents and Controls screen.
   b. Select the NaOH reagent kit and select New Lot.
   c. Enter the lot details and select Save.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
   f. Return to the original working browser tab and refresh the page.
6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet. Some of these fields are autopopulated and some must be manually completed.

Table 216 Fields on the Record Details Screen of Denature & Dilute (NovaSeq 6000 v3.0.1) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If the Use Custom Recipe option is selected, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.

Field	Value
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
Paired End	Select if applicable.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data

8. On the Record Details screen, select Validate Run Setup and Generate Sample Sheet. This selection triggers the automation script, which does the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.
9. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field is prepopulated with Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

10. Select Finish Step.
    On exit from the step:
    - The Routing Script automation is triggered and samples are routed to Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

At this point in the workflow, the user interaction ends. Proceed to *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)* on page 793

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step. The integration does this step automatically.

For Research Use Only. Not for use in diagnostic procedures.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0.1)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.0.1) step.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)
2. Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1)
3. Load to Flowcell (NovaSeq 6000 v3.0.1)

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0.1) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0.1) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Pooling screen:
   a. Create a pool by dragging samples into the Pool Creator.

      Only create one pool.

   b. Type a name for the pool or accept the default name (Pool #1).
   c. Select Record Details.
5. On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks the following details:
   - All samples in the pool have been assigned the same Flowcell Type.
   - Only one pool has been created.
6. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Lanes to Sequence—The value entered in this field is used in volume calculations to make sure that volumes are sufficient for the number of times the pool is sequenced.
   - Minimum Per Sample Volume (µl)—The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl). The value may be edited if necessary.

   Assuming the default Minimum Per Sample Volume (µl) value of 5 for a given batch:
   a. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
   b. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
7. In the Sample Details table, select the pool icon to view details on the pool composition.

For Research Use Only. Not for use in diagnostic procedures.

8. Select Calculate Volumes. This selection triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it and then open it in Excel.
9. Select Next Steps. This selection triggers the Set Next Step automation, which:
   - Copies the Flowcell Type values from the step inputs to the step outputs.
   - Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1).

   On the Assign Next Steps screen, the next step for samples is already set to the next step in the workflow: Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1).
10. Select Finish Step.

At the end of this step, the pool of samples automatically advances to the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.0.1)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.0.1) protocol. The pool of samples is queued for the Dilute, Denature, and ExAmp (NovaSeq 6000 v3.0.1) step.
2. Add the pool to the Ice Bucket and select View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (they are placed into the flow cell lanes) and select Begin Work.
4. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - Bp Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)

For Research Use Only. Not for use in diagnostic procedures.

- Mastermix per Lane (µl)
- The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains information about the DPX Mastermix volume, and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.

5. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Add and activate lots for these reagents.
   To add and activate reagent lots:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
      - Clarity LIMS v5: Navigate to the Consumables configuration screen.
      - Clarity LIMS v4: Navigate to the Reagents and Controls screen.
   b. Select one of the reagent kits listed previously (NaOH shown later) and select New Lot.
   c. Enter the lot details and select Save.
   d. Set the Status of Reagent Lot toggle switch to Active.
   e. Repeat this process to add and activate the remaining reagent lots.
   f. Return to your original working browser tab and refresh the page.
6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   - In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. These values are set by a script and are not editable while running the step.
7. In the Sample Details table, select the pool icon to view details on the working pool composition.
   - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are already populated. These values are set by a script and are not editable while running the step.
   - The Flowcell Type and Loading Workflow Type columns are already populated.
   - The working pool number is appended to the bulk pool name. This feature allows you to identify quickly which working pools are derived from the same bulk pool.
   - In the Files area, select the Calculation File (*csv) to open it and view details on the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool.
8. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.0.1).
9. Select Finish Step.

For Research Use Only. Not for use in diagnostic procedures.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.0.1)

1. On the Ice Bucket screen:
   a. In the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list.
   b. Select Begin Work.
2. The Validate Inputs and Selected Container automation checks the following details:
   - The Flowcell Type field has been set to a valid value (SP, S1, S2, or S4) and all inputs have the same value for this field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message states that the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   a. Drag the pools from the left of the screen over into the Placed Samples area on the right.
   b. Scan or type the barcode of the flow cell into the Flow Cell field.
   c. Select Record Details.

   On exit of the Placement screen, the Validate Flowcell Barcode automation checks that the container barcode conforms to the barcode mask for the selected Flowcell Type. See the following table. This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

Flow Cell Type	Barcode Mask
SP	[A-Za-z0-9]{5}DRX[XY2357]
S1	[A-Za-z0-9]{5}DRX[XY2357]
S2	[A-Za-z0-9]{5}DMX[XY2357]
S4	[A-Za-z0-9]{5}DSX[XY2357]

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.
   Some of these fields are autopopulated and some must be completed manually (see the following table for details).

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage.

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom.
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False.
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Compliment Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.

Field	Value
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Library Tube Barcode	Scan the library tube barcode.

5. Select Validate Run Setup and Generate Sample Sheet. This selection triggers the automation script, which does the following actions:
   - Validates the parameters entered on the Record Details screen.
   - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.
6. Select Next Steps.
   On the Assign Next Steps screen, the Next Step field for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.

At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

Proceed to *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)* on page 793.

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step. The integration does this step automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1)

This protocol contains a single fully automated step: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. No user interaction is required. However, you may open and review the various stages of the step in Clarity LIMS (see the *Review Run Data* on page 794 section).

Automated - NovaSeq Run (NovaSeq 6000 v3.0.1) contains two automations:

- Set Next Steps
- Update Lane Number

Set Next Steps automation is disabled (Set to Not Used). By default, the Sequencer API is used to set the next step for output samples.

The PCWP includes a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step. Use this automation to override the default next step behavior. See the NovaSeq Integration v3.2.1 User and Configuration Guide for details.

Update Lane Number automation is triggered automatically on entry to the Record Details screen.

Do not disable or modify this automation to make sure that the Lane Number is displayed properly.

Review Run Data

Read summary metrics are recorded for the library pool. After the run is complete, open the step and review these metrics on the Next Steps screen in the Step Data section and the Sample Details table.

Step Data Section

Values should be populated in the following step UDFs/master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle
- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number*
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

Sample Details Table

For Research Use Only. Not for use in diagnostic procedures.

Summary metrics should be populated in the following UDFs/global fields. Values are aggregated across all lanes. Some values—for example Yield PF (Gb) R1—are summed, while others are averaged:

- Yield PF (Gb) R1
- Yield PF (Gb) R2*
- Reads PF (M) R1*
- Reads PF (M) R2*
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

* For R2 Yield, R2 Error rate, and R2 Q30, there are discrepancies between the values shown in the Illumina SAV software and in the payload sent from the NVCS to Clarity LIMS. This issue is fixed in the upcoming NVCS release.

How the Integration Works

The following steps summarize how the Sequencer API integration works. For more detailed information, see the NovaSeq Integration v3.2.1 User and Configuration Guide.

1. When a run on the NovaSeq instrument is set up, NVCS sends a request for the run recipe.
    a. The Sequencer API validates that samples and containers are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step.

   b. Clarity LIMS sends a JSON response to NVCS. The response includes both the run recipe information and a link that can be used to download the sample sheet that is used with analysis software such as bcl2fastq2.
2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then:
   - Validates reagent kit information in the RunStarted request:
     - Checks that the reagent kit exists. If it does not, creates it and enables it on the master step.
     - Checks that the reagent kit is activated. If it is not, activates it.
   - Starts the step for the queued samples. The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   - Records all relevant information from the RunStarted request on the step, such as reagent lots and step fields.
3. At the end of the run, NVCS sends one of the following run status requests:
   - RunCompletedSuccessfully
   - RunEndedByUSer
   - RunErroredOut.
4. The Sequencer API then:
   - Updates the step with any new information. Currently, this update includes only the status and cycle/read information.
   - Updates the step with any new information. Currently, this update includes only the status and cycle/read information.
5. After primary analysis completes, NVCS sends a request containing the parsed run metrics. NVCS sends this request only when the run is completed successfully, but the API does not make this assumption and accepts the request regardless of status.
6. The Sequencer API then:
   - Records the metrics into the fields on file placeholder outputs in Clarity LIMS.
   - Completes the step in Clarity LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in progress. This process is the default autocomplete step behavior. For other configuration options, see the NovaSeq Integration v3.2.1 User and Configuration Guide.

The NovaSeq Integration v3.2.1 User and Configuration Guide provides detailed information on how the following components work with the Sequencer API integration:

- Sample sheet generation and contents
- NovaSeq run
- User authentication and login
- Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, see the following articles:

- *Troubleshooting Automated Informatics* section in the Clarity LIMS documentation.
- *Troubleshooting EPP/Automation* in the API > Clarity LIMS API and Database > Advanced Topics section

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq Integration Package by running the following command on the Clarity LIMS server command line:

```
rpm -qa | grep -i novaseq
```

2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step, review the log file information. See *Logging* on page 797.

If the automated run step starts but does not complete, review the following information:

1. Use one of the following methods to open the in progress step in Clarity LIMS:
   - Log in to the default user account.
   - In Lab View, find the step in the Recent Activities pane.
   - Search for the step in Clarity LIMS using either the Library Tube or Flow Cell barcode as the search term, depending on whether this run is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field contains logging information.
   - If you are unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the `sequencer-api.log` file described in the following section.
3. Contact the Clarity LIMS support team, supplying the relevant information from the troubleshooting steps already performed.

Additional troubleshooting information is provided on the Illumina Integrations FAQ page.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0.1) step, the Sequencer API writes a detailed log file to `/opt/gls/clarity/tomcat/current/logs/sequencer-api.log`.

Log messages include the Library Tube ID and Flow Cell ID whenever the messages are related to a sequencing run-related request. In Clarity LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the instrument, by default, has a name that includes the ID (Library Tube for Standard or Flow Cell for Xp) of the sequencing container. The relevant container name search finds most of the log messages for this request as well. However, to find all messages for downloading a file,

For Research Use Only. Not for use in diagnostic procedures.

you must know the LIMS ID of the file. Find this information by looking in the Clarity LIMS API and, for sample sheets used in a run, in the recipe response. The recipe response can also be found in the log file.

The following example lines are from the log file:

```
2018-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2018-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell

NovaSeq 6000 Integration v3.2.2 Release Notes

Compatibility

- Clarity LIMS v4.2 to v5.3. Not compatible with v5.4 or later.
- NGS Extensions Package v5.19. Not compatible with v5.20 or later.
- Preconfigured Workflow Package (PCWP) v1.2.2. Not compatible with v2.0 or later.
- NovaSeq Control Software (NVCS) v1.7.0.
- Illumina Bcl2FastQ v2.20.

Features to Note for this Release

This release of Clarity LIMS integration package provides:

- Support for the NovaSeq Control Software v1.7.0 with v1.5 reagents.
- Support for reverse complement workflow in sample sheet generation.
- Support for Unique Molecular Identifiers (UMI) configuration that is populated in sample sheet.
- Updated workflow (NovaSeq 6000 v3.0.1) delivered directly from PCWP v1.2.2.

Defect Fixed

- Fixed lane number discrepancy issue in Automated - NovaSeq Run step.

NovaSeq 6000 Integration v3.2.1 Configuration and User Interaction

The Illumina NovaSeq 6000 Integration Package v3.2.1 supports the integration of BaseSpace Clarity LIMS to Illumina NovaSeq 6000 sequencers.

Note the following key changes for this version of the integration:

- A move from a file-based to an API-based integration using the Sequencer API.
- NovaSeq-specific configuration is now installed as part of the Preconfigured Workflows Package (PCWP) v1.2. This configuration includes new template path locations and sample sheet generation with Template File Generator (TFG).

Configuration changes in v3.2.1 include the following:

- Support for Sequencer API
- Support for SPrime (SP) flow cell
- Support for Long-Read sequencing (SP flow cell only)
- Support for asymmetric read lengths

This *User and Configuration Guide* describes the integration and includes information about the preconfigured workflows, protocols, steps, and automations. The guide also lists installed components, and provides configuration requirements, rules, and constraints.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, see the *NovaSeq 6000 Integration v3.2.1 Validation and Troubleshooting* on page 875.

The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows - including renaming protocols, steps, and fields - could break process.

Overview

The integration includes the following:

- Preconfigured NovaSeq 6000 v3.0 workflow that maps to lab protocols and instrument runs.
- Preconfigured protocols:
  - Run Format (NovaSeq 6000 v3.0)
  - NovaSeq Standard (NovaSeq 6000 v3.0) (supports the loading of pooled libraries into a library tube)
  - NovaSeq Xp (NovaSeq 6000 v3.0) (supports individual lane loading on the NovaSeq)
  - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)
- Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file is automatically uploaded to the sequencing instrument via the Sequencer API and is used to set up the run.
- Automatic validation of run setup information. This information is used to create the run recipe and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics into the LIMS, including:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)

  - Sequencing run parameters
  - Sequencing run data directory location
  - Real Time Analysis v3 (RTA3) version and other run specific information
- [Optional] Preconfigured Library Prep Validation v1.0 workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.0 workflow. See the *NovaSeq 6000 Integration v3.2.1 Validation and Troubleshooting* on page 875.

Information on these features is provided in the following sections.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v3.0 workflow as normalized libraries. That is, before they are assigned to the workflow:

- Samples have been accessioned into the LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For details on sample accessioning, see the following articles in the Samples section of the LIMS documentation for your version: LIMS Documentation v5.0 and v5.1 or LIMS Documentation v4.1 and v4.2:

- Sample Accessioning
- Using Sample Lists to Upload and Modify Samples

Samples can be assigned to the NovaSeq 6000 v3.0 workflow automatically (using a routing script), or manually from the Projects and Samples dashboard (see the *Assigning Samples to Workflows* article in the LIMS Documentation).

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v3.2.1 includes two workflows:

- NovaSeq 6000 v3.0
- Library Prep Validation v1.0 (optional, but recommended for validation purposes)

The following table lists and describes the protocols and steps included in these workflows.

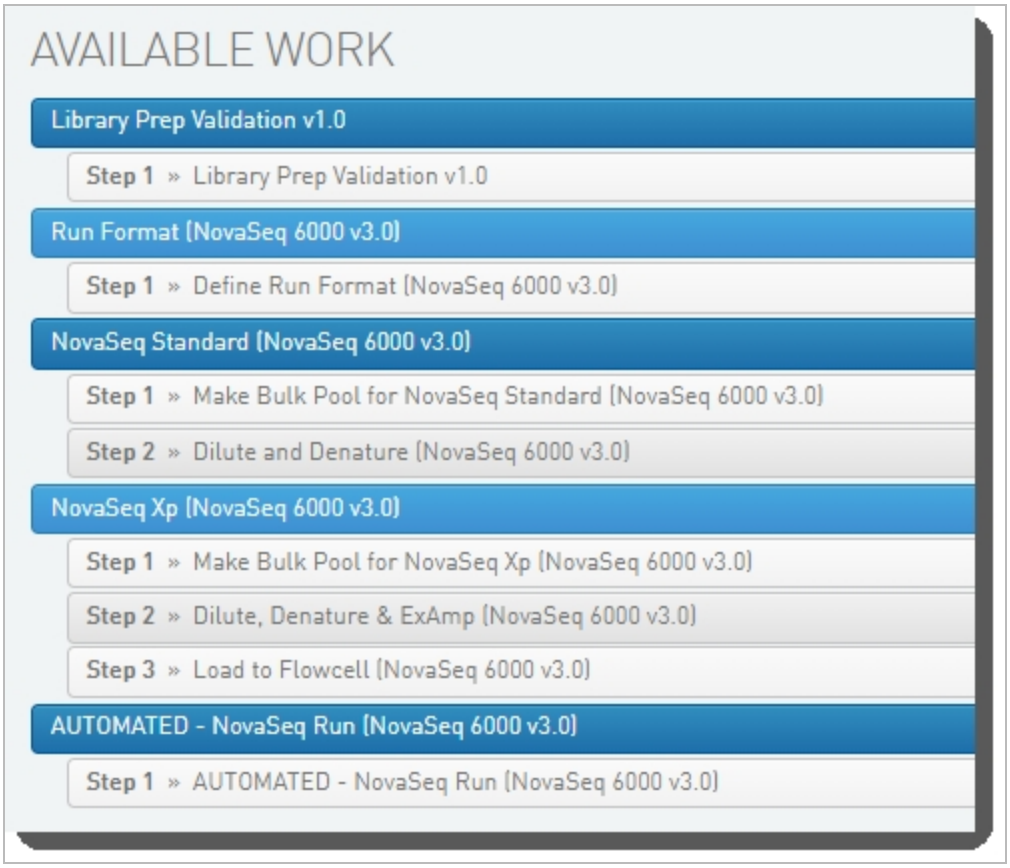
Library Prep Validation v1.0 workflow

Protocol name	Protocol purpose	Steps included in protocol
Library Prep Validation v1.0	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v3.0) protocol. The protocol contains a single step - Library Prep Validation v1.0. At the end of this step, a routing script sends the samples to the first step of the NovaSeq 6000 v3.0 workflow - Define Run Format (NovaSeq 6000 v3.0).	1. Library Prep Validation v1.0

NovaSeq 6000 v3.0 workflow

Protocol name	Protocol purpose	Steps included in protocol
Run Format (NovaSeq 6000 v3.0)	Allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM): • Loading Workflow Type: User selects from NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: User enters a value for each sample. • Flowcell Type: User selects from options SP, S1, S2, or S4. • Final Loading Concentration (pM): User selects from options 225 (PCR-free workflows) or400 (Nano workflows), or may enter a different value. Compares each sample's Normalized Molarity value with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	1. Define Run Format (NovaSeq 6000 v3.0)

Library Prep Validation v1.0 workflow



Protocol name	Protocol purpose	Steps included in protocol

NovaSeq 6000 v3.0 workflow

Protocol name	Protocol purpose	Steps included in protocol
NovaSeq Standard (NovaSeq 6000 v3.0)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. Run setup information is validated and sample sheet is generated. Routing script sends library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v30) protocol.	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) 2. Dilute and Denature (NovaSeq 6000 v3.0)
NovaSeq Xp (NovaSeq 6000 v3.0)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.0) step. Run setup information is validated and sample sheet is generated. Routing script sends flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v30) protocol.	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) 2. Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) 3. Load to Flowcell (NovaSeq 6000 v3.0)
AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)	All samples complete the workflow by going through this protocol. This protocol contains one fully-automated step. **!** The user must not add samples to the Ice Bucket or start the step. The integration will do this automatically.	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v30)

The following image show the protocols and their steps displayed in the LIMS Lab View.

For Research Use Only. Not for use in diagnostic procedures.

Validation Workflow

The Library Prep Validation v1.0 workflow allows for validation of the system after installation is complete. For details, see the *NovaSeq 6000 Integration v3.2.1 Validation and Troubleshooting* on page 875.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v3.0 workflow. Automation details are provided in the sections following the table.

For details on the validation workflow, see the *NovaSeq 6000 Integration v3.2.1 Validation and Troubleshooting* on page 875.

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v3.0)	1. Define Run Format (NovaSeq 6000 v3.0)	• Routing Script • Set Next Steps

Protocol	Step	Automation
2. NovaSeq Standard (NovaSeq 6000 v3.0)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes *Not used. This functionality is handled by the core LIMS configuration for pooling.*
	2. Dilute and Denature (NovaSeq 6000 v3.0)	• Routing Script • Validate Library Tube Barcode • Validate Run Setup and Generate Sample Sheet • Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v3.0)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes *Not used. This functionality is handled by the core LIMS configuration for pooling.*
	2. Dilute, Denature and ExAmp (NovaSeq 6000 v3.0)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v3.0)	• Validate Flowcell Barcode • Validate Inputs and Selected Container • Validate Run Setup and Generate Sample Sheet
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)	• Set Next Steps *Not used. By default, this functionality is determined by the Sequencer API.If required, you can enable the automation and use it to override the next step behavior used by the Sequencer API.*

Configuration Details

The sections below describe the configuration installed with the Illumina NovaSeq 6000 Integration.

As of LIMS v5, the term user-defined field (UDF) has been replaced with custom field in the user interface (the API resource is still called udf). There are two types of custom fields:

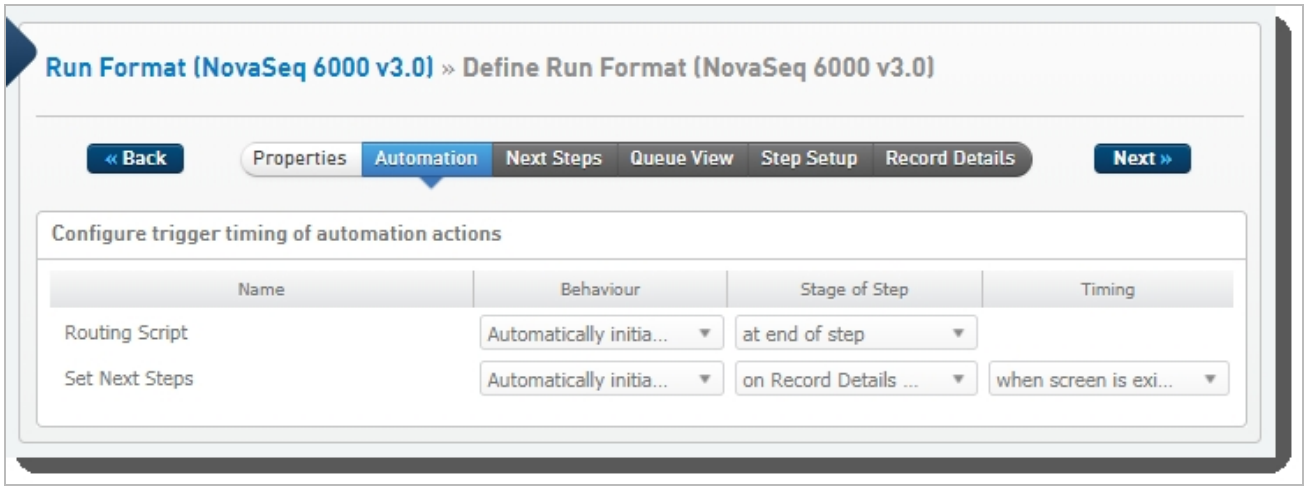
- Master step fields - configured on master steps. These fields only apply to the master step on which they are configured, and the steps derived from those master steps.
- Global fields - configured on entities such as submitted sample, derived sample, measurement, etc. These fields apply to the whole LIMS system.

Protocol 1: Run Format (NovaSeq 6000 v3.0

This protocol sets the Loading Workflow Type and allows the user to choose the appropriate Flowcell Type and Final Loading Concentration (pM). At the end of the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v3.0) or the NovaSeq Xp (NovaSeq 6000 v3.0) protocol.

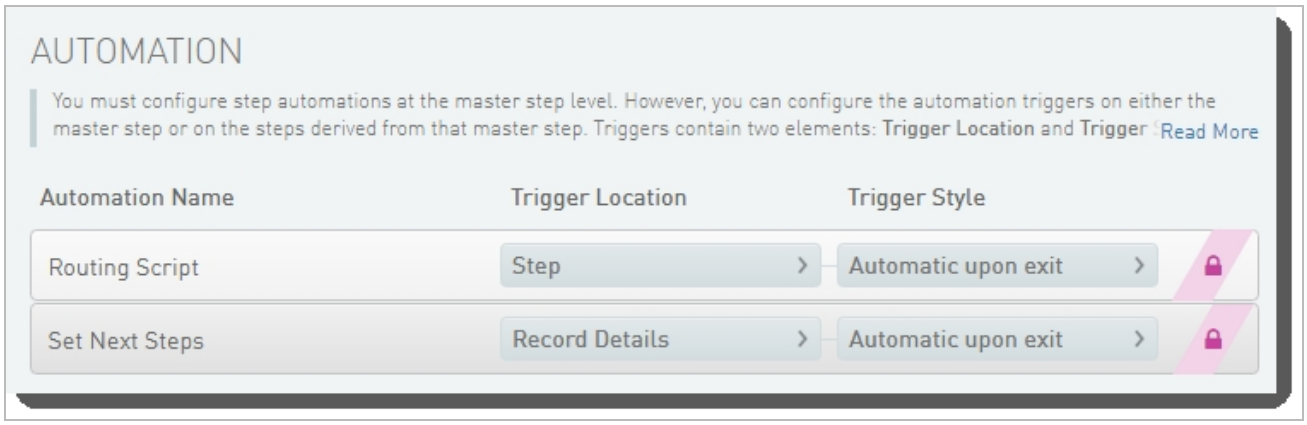
This protocol contains one step: Define Run Format (NovaSeq 6000 v3.0), described below.

Step 1. Define Run Format (NovaSeq 6000 v3.0)



Step input: NTP (normalized libraries)

Step output: None



The following automations are configured on this step:

- Routing Script
- Set Next Steps

Define Run Format (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

Define Run Format (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Set Next Steps

Automatically triggered on exit of the Record Details screen, this automation does the following:

- Sets the next step for samples to REMOVE:

```
nextStep = ::REMOVE::
```

- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (i.e., empty value, not including 0), generates an error message informing the user that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) { \
  fail(::The Normalized Molarity cannot be empty.::) ;
}
```

- Compares each sample's Normalized Molarity value with the Minimum Molarity value. If Normalized Molarity value is lower than the Minimum Molarity value, sets the sample's Loading Workflow Type to [Remove from workflow] and records a message in the Warning field for the sample:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::)
{ \
  input.::Warning:: = ::The Normalized Molarity is too low.:: ; \
  input.::Loading Workflow Type:: = ::[Remove from workflow]:: ; } \
else { input.::Warning:: = ::n/a:: }
```

  At this point the user has two options:

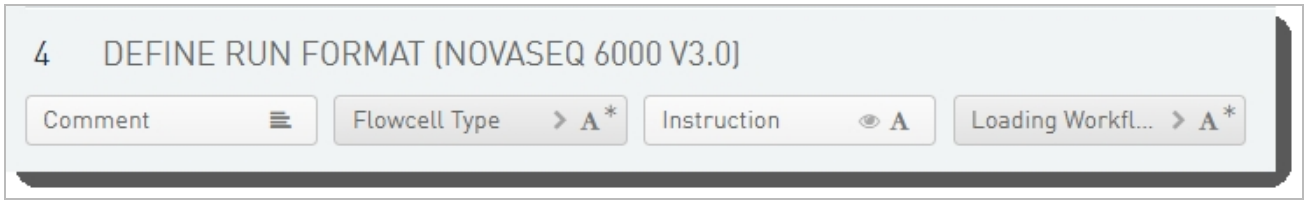
  - Correct the Normalized Molarity value on the Record Details screen. User will also need to edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.

– Complete the protocol without correcting the Normalized Molarity value. In this case, those samples will be removed from the workflow.

Routing Script

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value = NovaSeq Standard are routed to the NovaSeq 6000 v3.0 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step.
- Samples with Loading Workflow Type field value = NovaSeq Xp are routed to the NovaSeq 6000 v3.0 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step.



Default automation command line:

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l
{compoundOutputFileLuid0} script:changeWorkflow \\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v3.0' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \--WORKFLOW 'NovaSeq 6000 v3.0' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Step UDFs/Custom Fields

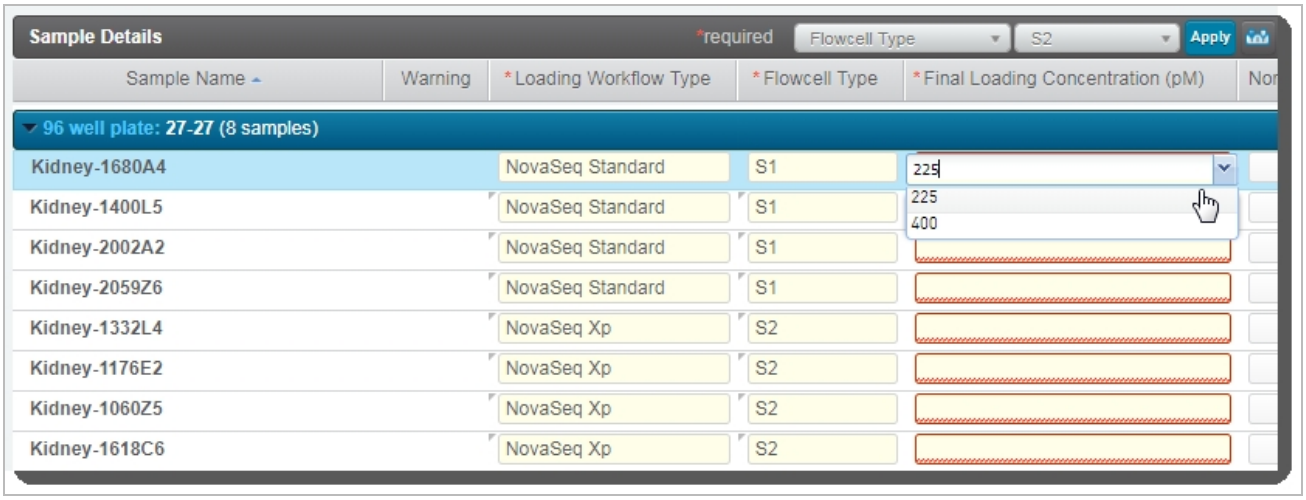
There are four fields defined on the Define Run Format (NovaSeq 6000 v3.0) step.

These are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Constraints	Preset Values/Additional Options and Dropdown Items
Comment	Multi-line Text	• Required: No • Read Only: No	None
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• SP • S1 • S2 • S4
Instruction	Single-line Text (v4.2.x) Text (v5.x)	• Required: No • Read Only: Yes	• Default: Add Flowcell Type and Loading Workflow Type below
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp

Global UDFs/Custom Fields



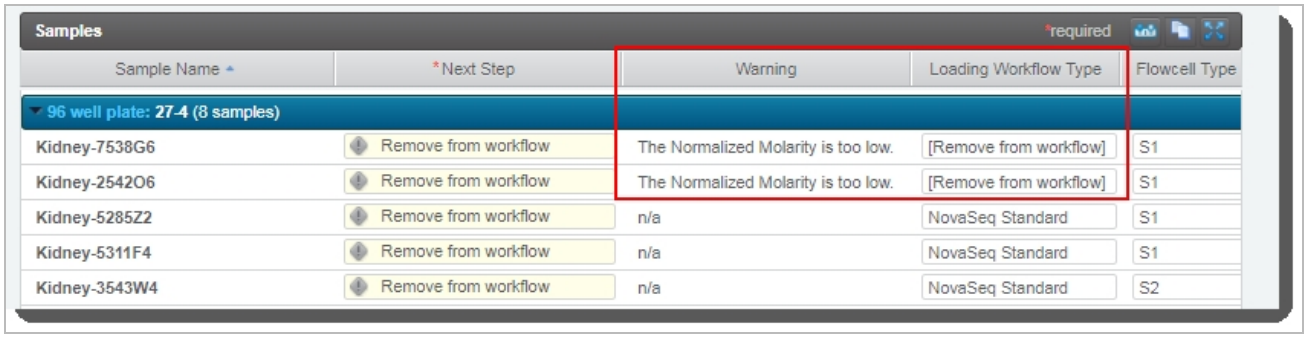
The following table lists the global UDFs/custom fields that are configured to display on the Define Run Format (NovaSeq 6000 v3.0) step.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Samplein LIMS v5.x:			
Adjusted Per Sample Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Final Loading Concentration (pM)	Numeric (v4.2.x) Numeric Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 225 • 400 • Decimal Places Displayed: 0
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Minimum Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Normalized Molarity (nM)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Per Sample Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Warning	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: No • Read Only: Yes • Custom Entries: Yes	• The Normalized Molarity (nM) is too low. • n/a

User Interaction

1. On the Record Details screen, the Sample Details table contains the following fields that must be completed (values can vary across samples):
    - Loading Workflow Type: Users selects NovaSeq Standard or NovaSeq Xp from the drop-down list.
    - Flowcell Type: User selects SP, S1, S2, or S4 from the drop-down list.
    - Final Loading Concentration (pM): User selects from the two preset options - 225 (for PCR-free workflows) or400 (for Nano workflows), or may enter a different value.
    - Normalized Molarity (nM):These values are copied over from the previous step. If the user did not populate this column during library prep, they can enter the values here.



- User clicks Next Steps. This triggers the Next Steps automation, which does the following:

- Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value, and requires it in order to successfully advance samples to the next step.
- Calculates the Minimum Molarity.
- Checks Normalized Molarity value. For samples with no Normalized Molarity value (i.e., empty value, not including 0), generates an error message informing the user that the field cannot be empty.
- Compares each sample's Normalized Molarity value with the Minimum Molarity value.

2. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is pre-populated with Remove from workflow - regardless of the Loading Workflow Type.

> The user must not change this value. If Next Step is not set to Remove from workflow, the routing script will not be able to route samples correctly.

For samples whose Normalized Molarity value was found to be lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow and a message is recorded in the Warningfield for the sample:

At this point the user has two options:

- Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. User will also need to set the Loading Workflow Type to NovaSeq Standard.
- Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question will be removed from the LIMS workflow.

3. User clicks Finish Step. The Routing Script automation is triggered:
   - Samples whose Loading Workflow Type is set to Remove from workflow (i.e., whereNormalized Molarity value is lower than the Minimum Molarity) are removed from the LIMS workflow.
   - Samples whose Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step. This is the first of two steps in the NovaSeq Standard (NovaSeq 6000 v3.0) protocol.

- Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step. This is the first of three steps in the NovaSeq Xp (NovaSeq 6000 v3.0) protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) protocol.

This protocol contains two steps, described below:

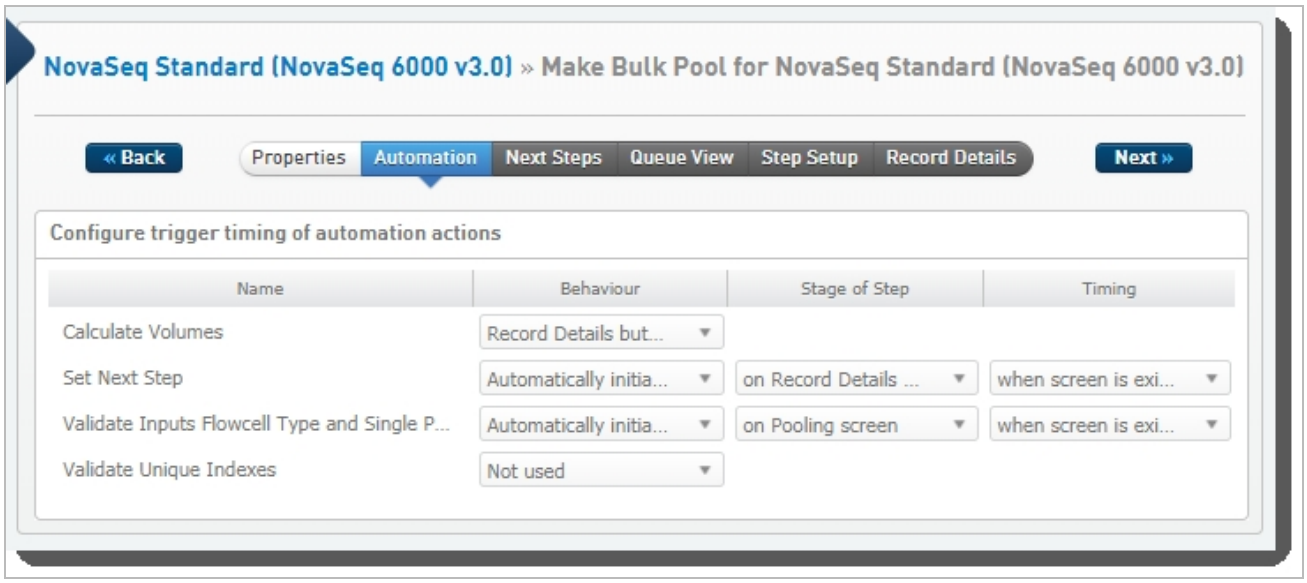
- Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)
- Step 2: Dilute and Denature (NovaSeq 6000 v3.0)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)

In this step, user manually places libraries into a single pool. Resuspension buffer and reagents are added.

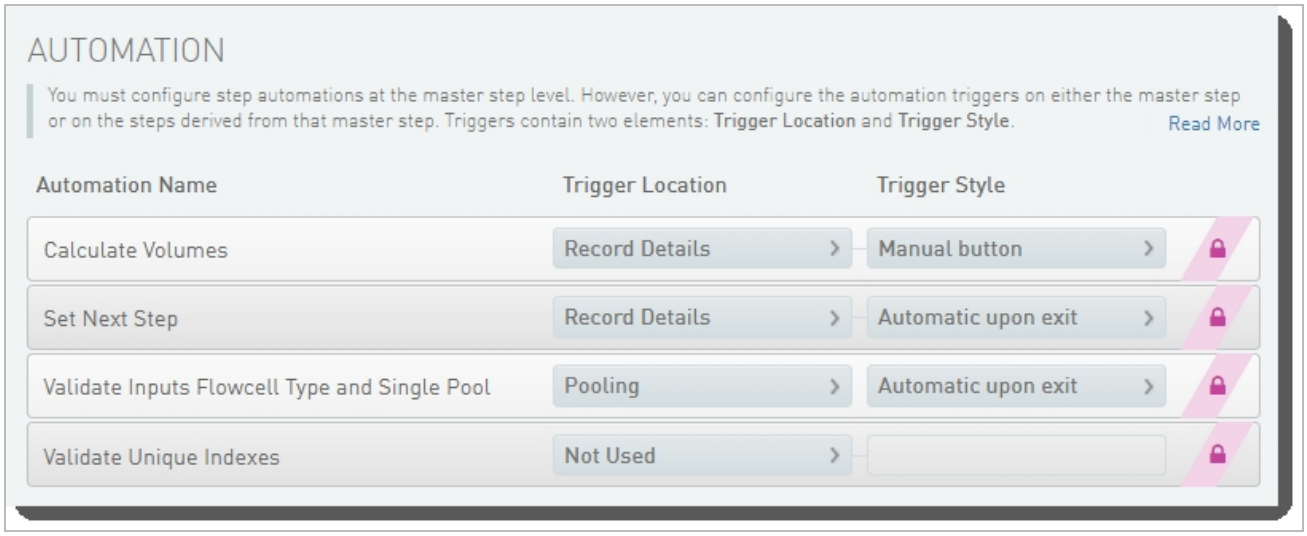
User must only create only one pool per step.

Step input: NTP (normalized libraries)



Step output: Bulk pool

The following automations are configured on the step:



- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes*(Not used. This functionality is handled by the core LIMS configuration for pooling.)*

Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

For Research Use Only. Not for use in diagnostic procedures.

Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created. Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar \script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
```

```
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes

Automatically triggered when the user clicks the Calculate Volumes button on the Record Details screen, this automation:

- Calculates the number of samples in the pool:

```
-exp 'step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: +
1'
```

- Sets the value of the Bulk Pool Volume (ul) field, based on the selected Flowcell Type:

```
-exp 'if ( input.::Flowcell Type:: == ::SP:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30
} ;

if ( input.::Flowcell Type:: == ::S1:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100
+ 30
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150
+ 30
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310
+ 30
} ;
```

- Calculates the Per Sample Volume (ul) to be added to the pool:

```
input.::Per Sample Volume (ul):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (ul):: ) / step.::Number of Samples in Pool::
```

For Research Use Only. Not for use in diagnostic procedures.

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (ul) value must be equal to or higher than the Minimum Per Sample Volume (ul) (default value set at 5, may be edited by the user).

Assuming the default Minimum Per Sample Volume (ul) value of 5, for a given batch:

1. If the smallest Per Sample Volume (ul) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (ul) field.
2. The LIMS then adjusts the Adjusted Per Sample Volume (ul) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (ul) field value:

```
-exp 'step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: +
input.::Adjusted Per Sample Volume (ul)::'
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (ul) field value:

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0} else {output.::RSB Volume (ul):: = step.::Bulk
Pool Volume (ul):: - step.::Total Sample Volume (ul)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ;output.::Loading Workflow
Type:: = input.::Loading Workflow Type:: ;
```

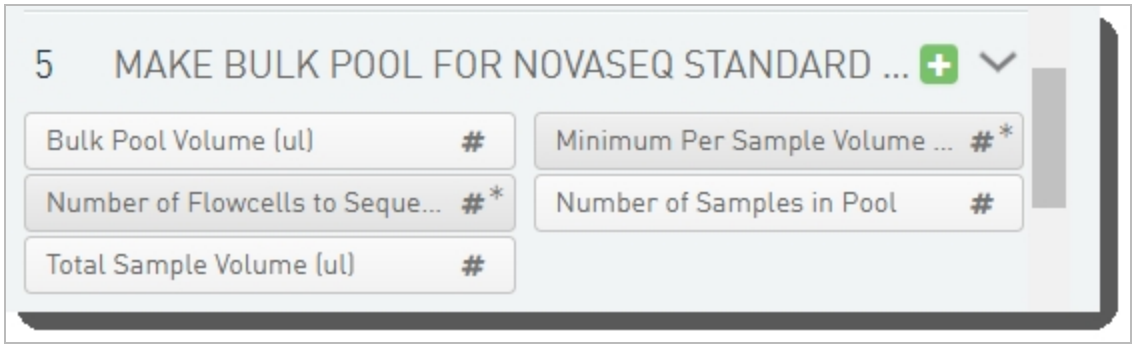
- Sets the Volume of Pool to Denature (ul) value and calculates NaOH Volume (ul) and Tris-HCl Volume (ul) values, based on the Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume (ul)::
= 25 } ;
if ( input.::Flowcell Type:: == ::S1:: ) { output.::Volume of Pool to Denature
(ul):: = 100 ; output.::NaOH Volume (ul):: = 25 ; output.::Tris-HCl Volume (ul)::
= 25 } ;
if ( input.::Flowcell Type:: == ::S2:: ) {output.::Volume of Pool to Denature
(ul):: = 150 ; output.::NaOH Volume (ul):: = 37.50 ; output.::Tris-HCl Volume
(ul):: = 37.50 } ;
if ( input.::Flowcell Type:: == ::S4:: ) { output.::Volume of Pool to Denature
(ul):: = 310 ; output.::NaOH Volume (ul):: = 77.50 ; output.::Tris-HCl Volume
(ul):: = 77.50 }
```

- Uses the NovaSeq_Standard_Bulk_Pool1.csv, NovaSeq_Standard_Bulk_Pool2.csv and NovaSeq_Standard_Bulk_Pool3.csv template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download by the user on the Step Setup screen of the following step - Dilute and Denature (NovaSeq 6000 v3.0).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p {password}
-l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool1.csv \
  -o 1.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool2.csv \
  -o 2.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Standard_Bulk_
Pool3.csv \
  -o 3.csv \
&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

Set Next Step



Automatically triggered on exit of the Record Details screen, this automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute and Denature (NovaSeq 6000 v3.0):

```
nextStep = ::ADVANCE::
```

Step UDFs/Custom Fields

There are five fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step.

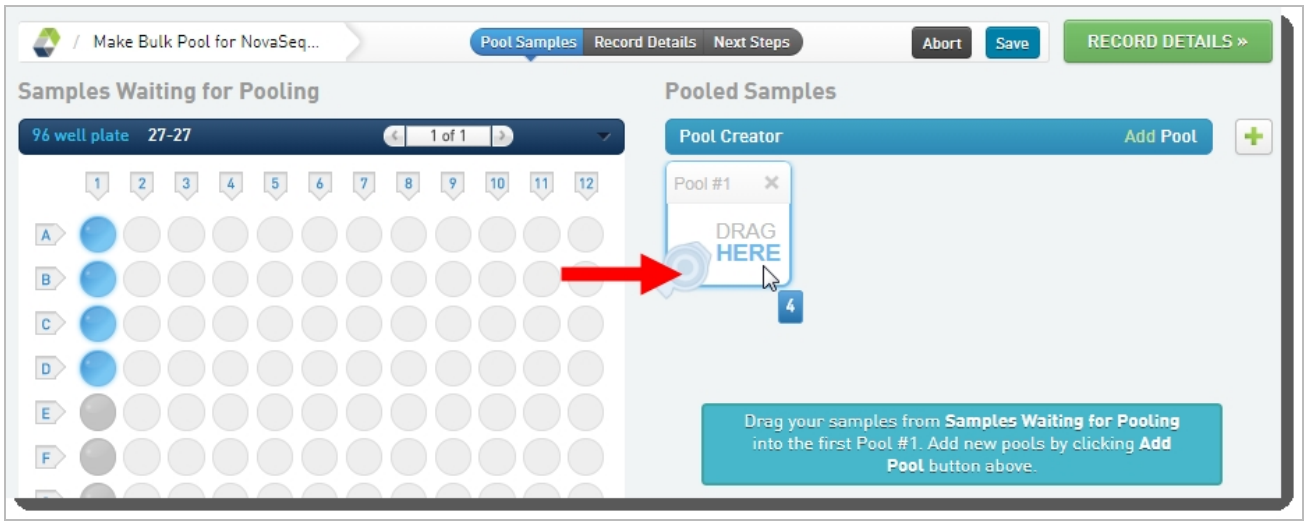
These are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (C ustom Fields > Master Step Fields tab).

See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Bulk Pool Volume (ul) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Flowcells to Sequence	Numeric	• Required: Yes • Read Only: No	• Range From:1 to 10 • Decimal Places Displayed: 0
Total Sample Volume (ul) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 2
Minimum Per Sample Volume (uL)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0

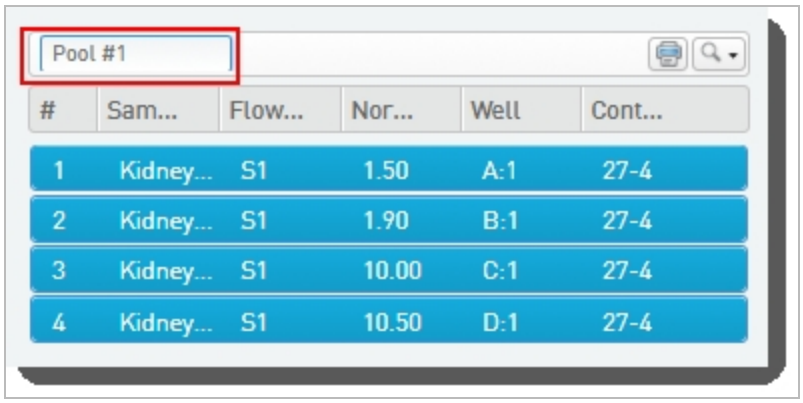
Global UDFs/Custom Fields

The following table lists the global UDFs/custom fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step.



Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Samplein LIMS v5.x:			
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
NaOH Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
RSB Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Volume of Pool to Denature (ul) *Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step only. Displays on Record Detailsscreen and in the generated CSV file.*	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

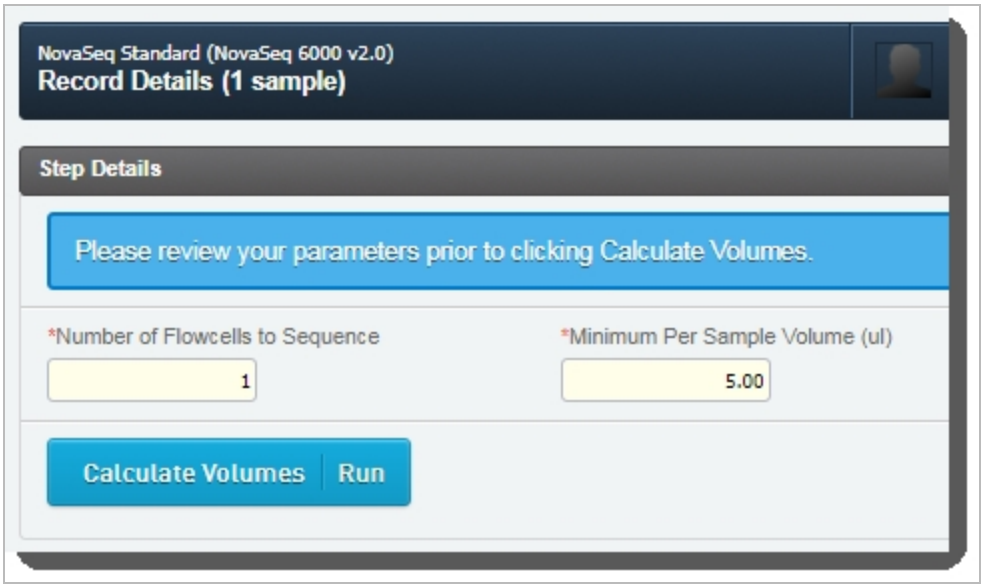


User Interaction

1. On the Queue screen, user adds samples of the same Flowcell Type to the Ice Bucket and clicks View Ice Bucket.
2. On the Ice Bucket screen, user clicks Begin Work.
3. On the Pooling screen, user:
    - Creates a pool by dragging samples into the Pool Creator.

For Research Use Only. Not for use in diagnostic procedures.

- Names the pool, or accepts the default name - Pool #1.

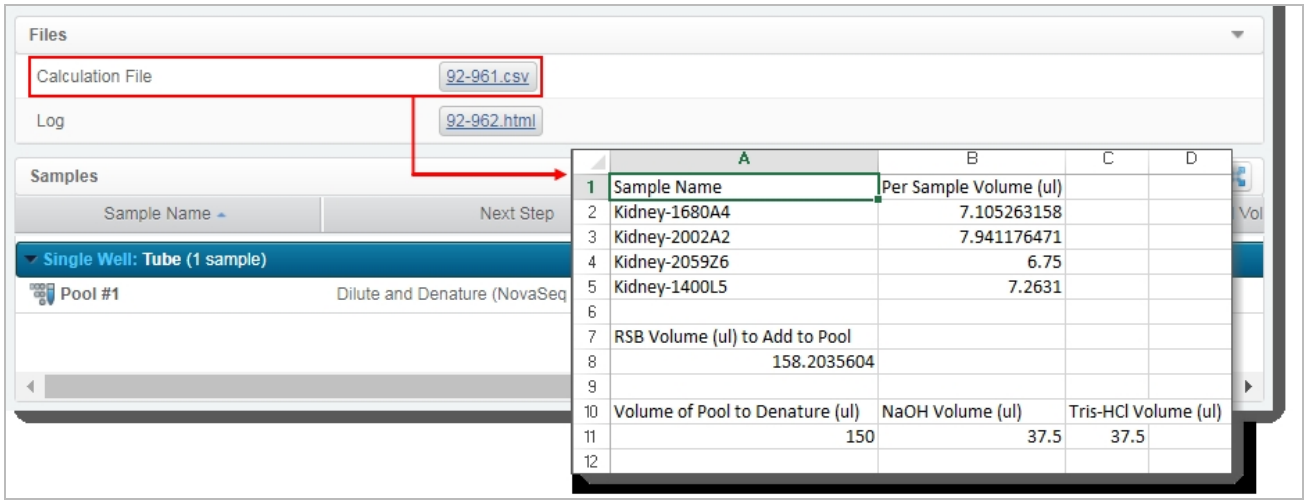


- Clicks Record Details.

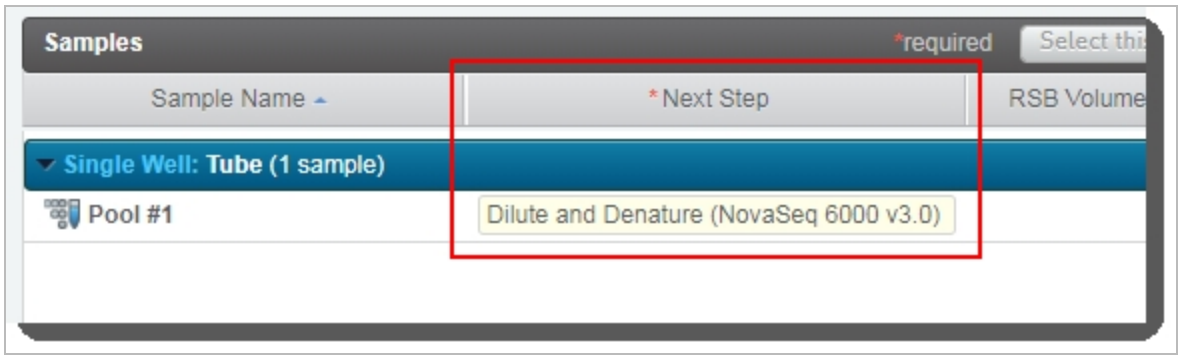
  On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type, and only one pool has been created.

4. On the Record Details screen, the Step Details area contains two required fields:
   a. Number of Flowcells to Sequence - The value entered in this field is used in volume calculations, to ensure that volumes are sufficient for the number of times the pool will be sequenced.
   b. Minimum Per Sample Volume (ul) - In many applications, and particularly where robotics are used, a minimum sample volume is required. The value in this field is used to calculate how much of each sample will be included in the pool. The field is pre-populated with the configured default value, 5 ul, but may be edited if required.

For Research Use Only. Not for use in diagnostic procedures.



c. In the Sample Details table, the user can click on the pool icon to view details on the pool composition.



d. The user clicks Calculate Volumes. This triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (ul) value.
   - Sets the value of the Bulk Pool Volume (ul) field, based on the selected Flowcell Type.
   - Calculates the Per Sample Volume (ul) value to be added to the pool.
   - Calculates the Total Sample Volume (ul) value.

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (ul) value.
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (ul), NaOH Volume (ul) and T ris-HCl Volume (ul) columns of the Sample Details table. (Values are set by a script and are not editable by the user.)
- Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains.The user can click on the file to download it, and then open it in Excel.

- The user clicks Next Steps. This triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute and Denature (NovaSeq 6000 v3.0).

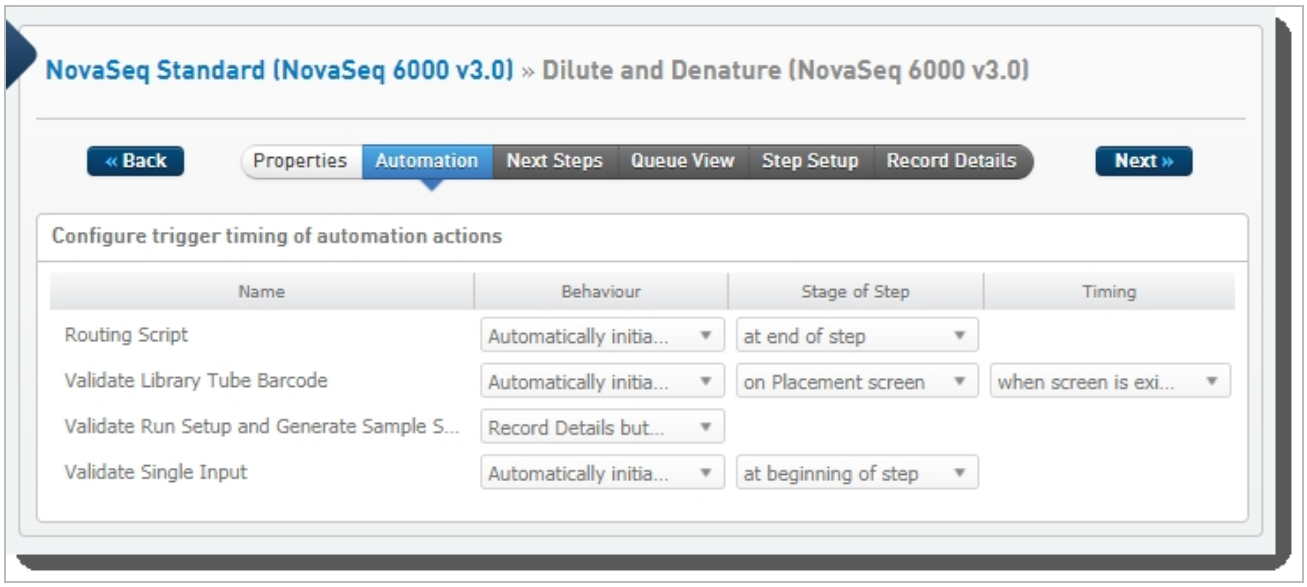
e. On the Assign Next Steps screen: The next step is already set to Dilute and Denature (NovaSeq 6000 v3.0).

- User clicks Finish Step. At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.0) step.

Step 2: Dilute and Denature (NovaSeq 6000 v3.0)

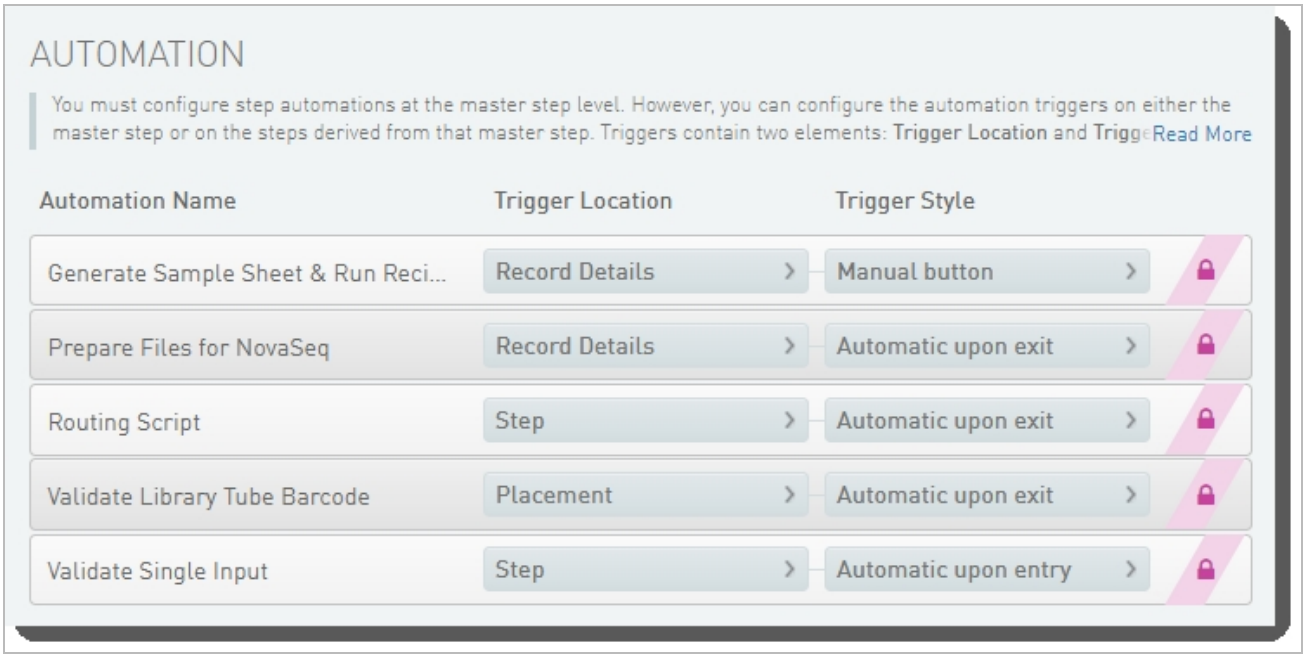
In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB), and are manually placed by the user into the library tube that will be used in the NovaSeq run.

In addition, this step validates the run setup information and generates the sample sheet file.



Step input: Bulk pool

Step output: Library tube



The following automations are configured on the step:

- Routing Script
- Validate Library Tube Barcode
- Validate Run Setup and Generate Sample Sheet
- Validate Single Input

Dilute and Denature (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

Dilute and Denature (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Validate Single Input

Automatically triggered at the beginning of the step, this automation checks that there is only one container input to the step.

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode

Automatically triggered on exit of the Placement screen, this automation:

- Validates the library tube barcode to ensure it conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}:

```
if (!output.container.name.matches(::[A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}::)) { fail
(::Invalid Library Tube Barcode. Please verify and try again.::) }
```

- Copies Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; output.::Loading Workflow
Type:: = input.::Loading Workflow Type::'
```

Validate Run Setup and Generate Sample Sheet

Automatically triggered when user clicks a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which will be used to set up the run and generate the sample sheet file (see *Respond to Validation/Recipe Request Call from Sequencer on page 863*, below).
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, Index Read 1 must be zero. For any other Workflow Type, Index Read 1 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
  fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if(step.::Workflow Type::== ::No Index::) {
  if(step.::Index Read 1::!= 0) {
    fail(::Index Read 1 must be 0 if the Workflow Type is No Index.::)
  }
} else {
  if(step.::Index Read 1::== 0) {
    fail(::Index Read 1 must be greater than 0 if the Workflow Type is ::+
step.::Workflow Type::+ ::.::)
  }
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = True and Read 2 Cycles value is 0, generates an error.

```
if (step.::Paired End::.toBoolean() && step.::Read 2 Cycles:: == 0) {
  fail(::Read 2 Cycles must not be zero if it is Paired End read.::)
};
```

- Checks the Workflow Type and Read 2 Cycles field values.
  - If Workflow Type is set to Dual Index and Index Read 2 value is 0, generates an error.
  - If Workflow Type is set to No Index or Single Index, sets Index Read 2 to 0.

```
if (step.::Workflow Type:: == ::Dual Index:: && step.::Index Read 2:: == 0) {
  fail(::Index Read 2 must not be zero if Workflow Type is Dual Index.::)
};
if (step.::Workflow Type:: == ::No Index:: || step.::Workflow Type:: == ::Single
Index::) {
  step.::Index Read 2:: = 0
};
```

- If Paired End = False, sets Read 2 Cycles value to 0.

```
if (!step.::Paired End::.toBoolean()) { step.::Read 2 Cycles:: = 0 };
```

- Checks the Flowcell Type field value.

For Research Use Only. Not for use in diagnostic procedures.

  - If Flowcell Type value is not SP, checks that the value of both Read 1 Cycles and Read 2 Cycles is 151 or less. If value is greater than 151, generates an error message.

```
if (input.::Flowcell Type::!=::SP:: && step.::Read 1 Cycles:: > 151) { fail
(::Read 1 Cycles must not be larger than 151 if it is not SPrime Flowcell::) };if
(input.::Flowcell Type::!=::SP:: && step.::Read 2 Cycles:: > 151) { fail(::Read 2
Cycles must not be larger than 151 if it is not SPrime Flowcell::)
```

- Sets the next step for samples to REMOVE:

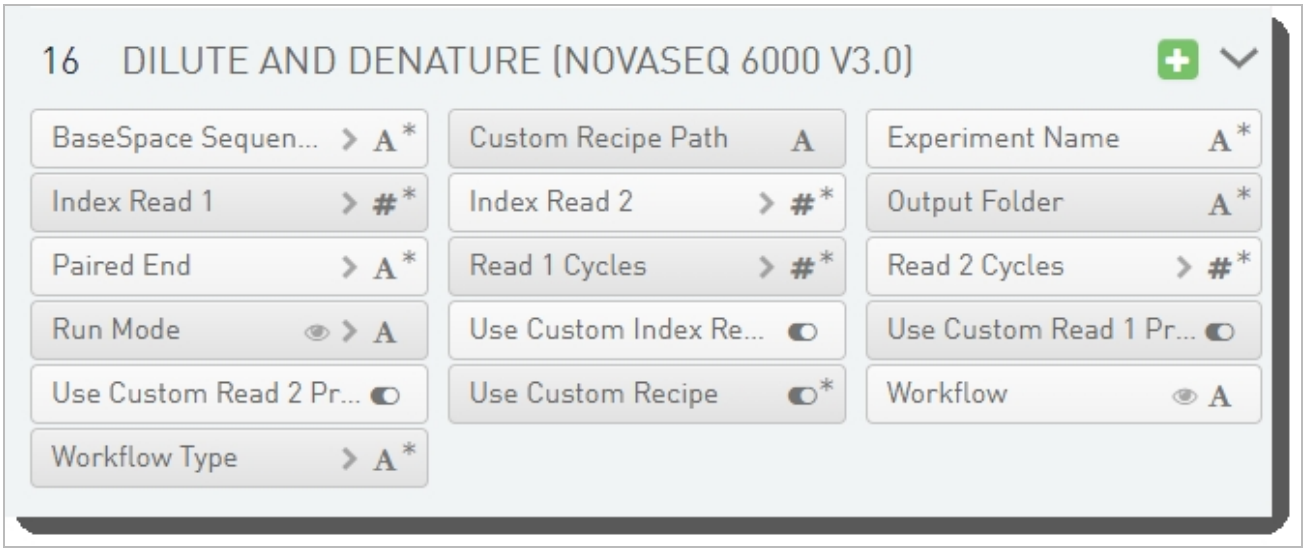
```
nextStep = ::REMOVE::
```

- Generates the sample sheet and attaches it to the step (see Sample sheet generation section, below).

```
&& /opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar -i {stepURI:v2} -u {username} -p {password}
\   script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_BCL2FASTQ_
Samplesheet.csv \
  -o {compoundOutputFileLuid0}.csv \
  -q true \
  -destLIMSID {compoundOutputFileLuid0} \
  -l {compoundOutputFileLuid1}"
```

Routing Script

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeq 6000 v3.0 workflow, and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.



Default automation command line:

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l
{compoundOutputFileLuid2} script:changeWorkflow \ \
  --FIELD_NAME 'N/A' \
  --FIELD_VALUE 'N/A' \
  --WORKFLOW 'NovaSeq 6000 v3.0' \
  --STEP 'AUTOMATED - NovaSeq Run (NovaSeq 6000 v30)' \
  --INPUTS_OR_OUTPUTS 'OUTPUTS'"
```

Step UDFs/Custom Fields

There are 16 fields defined on the Dilute and Denature (NovaSeq 6000 v3.0) step. These fields are required for sample sheet and JSON file generation.

The fields are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• Not Used • Run Monitoring Only • Run Monitoring and Storage
Custom Recipe Path	Single-line Text (v4.2.x) Text (v5.x)	• Required: No • Read Only: No	
Experiment Name	Single-line Text (v4.2.x) Text (v5.x)	• Required: Yes • Read Only: No	
Index Read 1	Numeric (v4.2.x) Numeric Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0
Index Read 2	Numeric (v4.2.x) Numeric Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 0 • 6 • 8 • Range From: 0 to 20 • Decimal Places Displayed: 0

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Output Folder	Single-line Text (v4.2.x) Text (v5.x)	• Required: Yes • Read Only: No	
Paired End	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• True • False
Read 1 Cycles	Numeric (v4.2.x) Numeric Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 **Value of 251 is only supported for SPflow cell type. For all other flow cell types, maximum value is 151.*
Read 2 Cycles	Numeric (v4.2.x) Numeric Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: Yes	• 251* • 151 • 101 • 51 • Range From: 1 to 251 • Decimal Places Displayed: 0 **Value of 251 is only supported for SPflow cell type. For all other flow cell types, maximum value is 151.*
Run Mode *(not displayed in user interface)*	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: No • Read Only: Yes • Custom Entries: No	• SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
Use Custom Index Read 1 Primer LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237	Check Box (v4.2.x) Toggle Switch (v5.x)	• Required: No • Read Only: No	• None Set

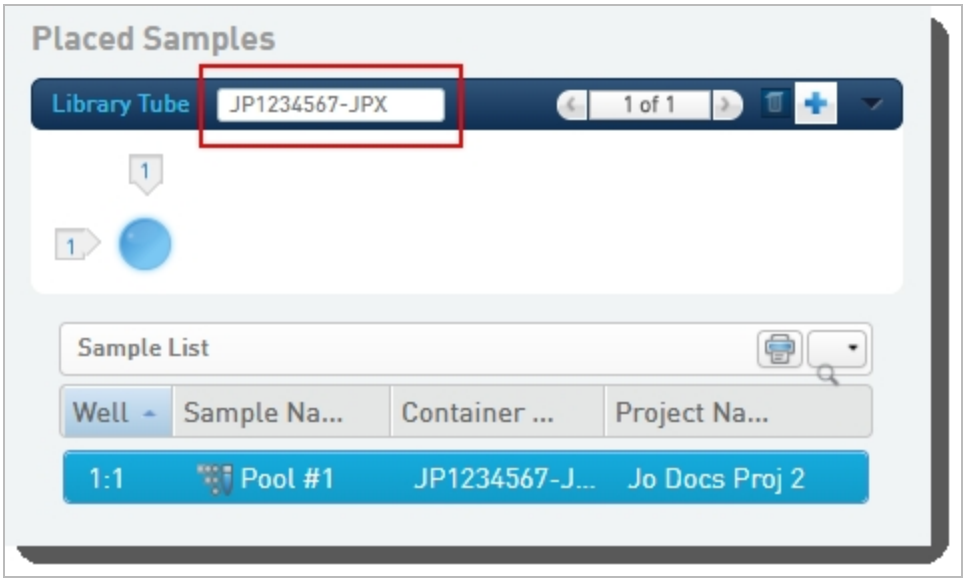
Global UDFs/Custom Fields

The following table lists the global UDFs/custom fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v3.0) step.



Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Samplein LIMS v5.x:			
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

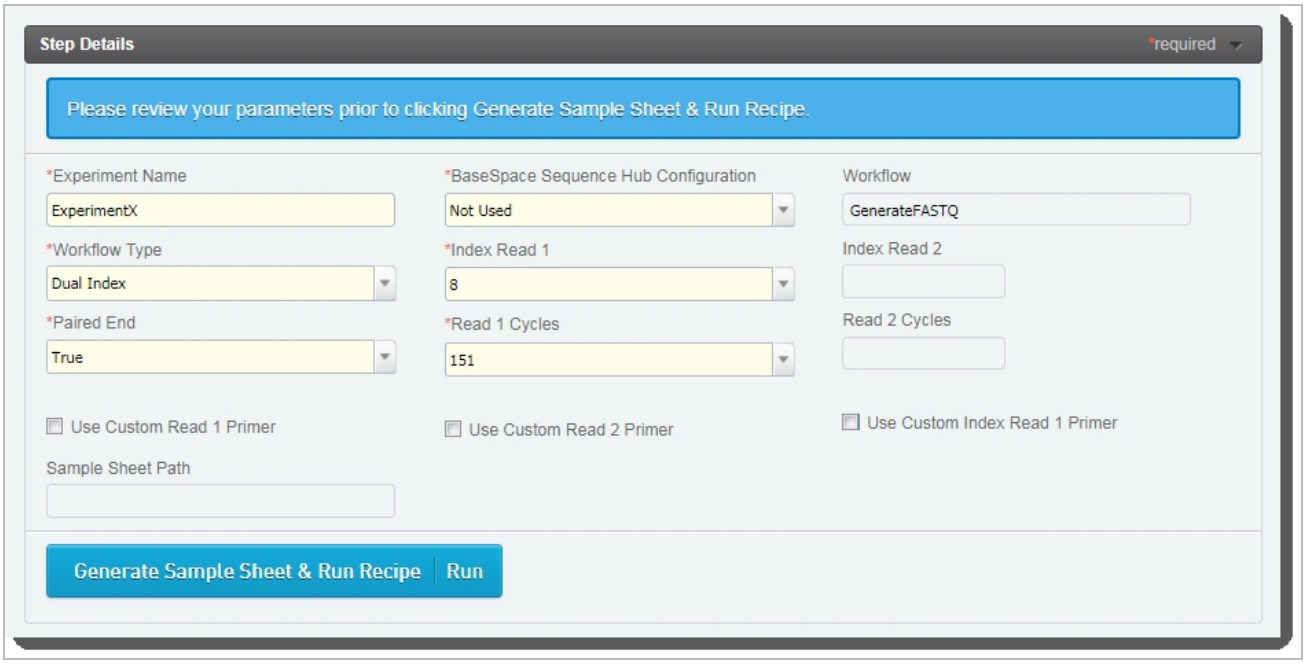
User Interaction

1. On the Placement screen, user does the following:
    - Drags the pool into the library tube in the Placed Samples area.

    - Scans or types the barcode of the library tube into the Library Tube field.

- Clicks Record Details.

On exit of the Placement screen, the Validate Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}, and displays an error message if this is not the case.



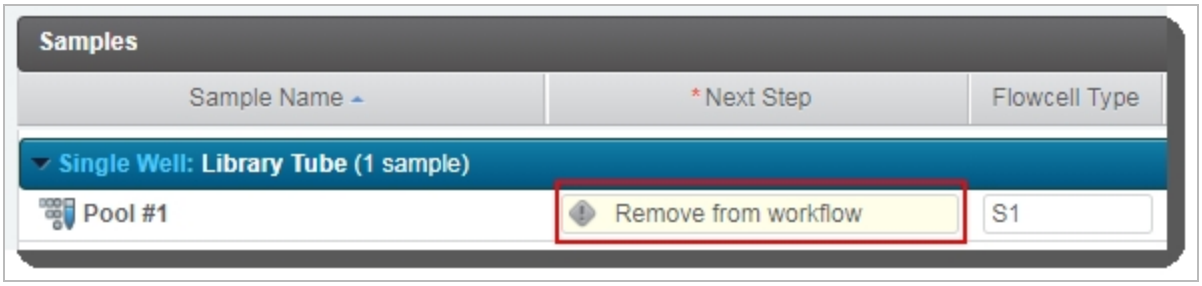
2. On the Record Details screen:
   - The Reagent Lot Tracking section lets you track the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. The user selects from the active lots displayed in each drop-down list.

To make reagent lots available for selection in the Reagent Lot Tracking section, you must first configure and activate them. You can do this on the Reagents and Controls screen (LIMS v4.2.x) or the Configuration > Consumables screen (LIMS v5.x).

- The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet file.

For Research Use Only. Not for use in diagnostic procedures.

Some of these fields are auto-populated and some must be completed by the user (see the following table for details):



Field	Value
Experiment Name	User enters the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	User selects from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage
Workflow	Automatically populated with preset - GenerateFASTQ
Workflow Type	User selects from preset options: No Index, Single Index, Dual Index, Custom
Index Read 1	User selects from preset options: 0, 6, 8 - or type a value between 0 and 20
Index Read 2	User selects from preset options: 0, 6, 8 - or type a value between 0 and 20
Paired End	User selects from preset options: True or False
Read 1 Cycles	User selects from preset options: 251, 151, 101, 51 - or type a value between 1 and 251 Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	User selects from preset options: 251, 151, 101, 51 - or type a value between 1 and 251 Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

Field	Value
Use Custom Read 1 Primer	User selects if applicable.
Use Custom Read 2 Primer	User selects if applicable.
Use Custom Index Read 1 Primer	User selects if applicable.
Output Folder	User enters the network path for sequencing run folder. For example: \\networkshare\run_data
Use Custom Recipe	User selects if applicable.
Custom Recipe Path	If Use Custom Recipe selected, user enters the path to the custom recipe file to be used.

3. On the Record Details screen, user clicks Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which does the following:
    - Validates the information provided to set up the run.
    - Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Detailsscreen.

    - Sets the value of the next step to Remove from workflow. The Routing Script automation expects this value, and requires it in order to successfully advance samples to the next step.
    - User clicks Next Steps.
4. On the Assign Next Steps screen: The Next Step field for all samples is pre-populated with Remove from workflow.

For Research Use Only. Not for use in diagnostic procedures.

The user must not change this value. If Next Step is not set to Remove from workflow, the routing script will not be able to route samples correctly.

- User clicks Finish Step.

5. On exit from the step:
    - The Routing Script automation is triggered and samples are routed to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) protocol.
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step and data from the run is parsed back into the LIMS.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0)

Samples are routed to this protocol if their Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v3.0) step. At the end of this protocol, the flow cell is sent to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) protocol.

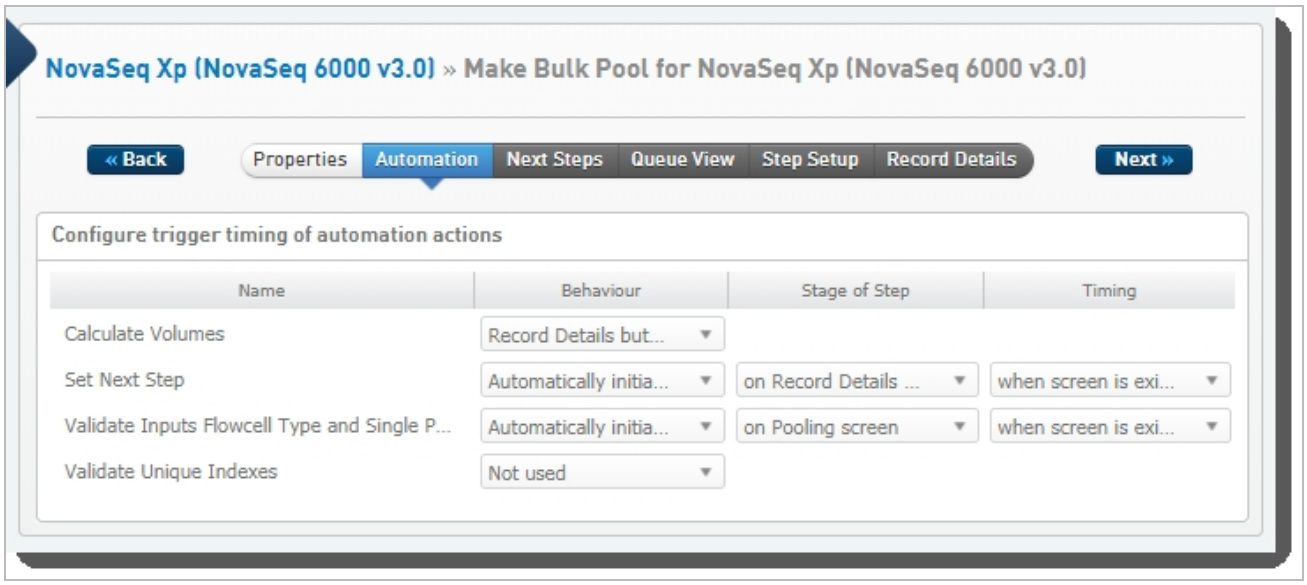
This protocol contains three steps, described below:

- Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)
- Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.0)
- Step 3: Load to Flowcell (NovaSeq 6000 v3.0)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)

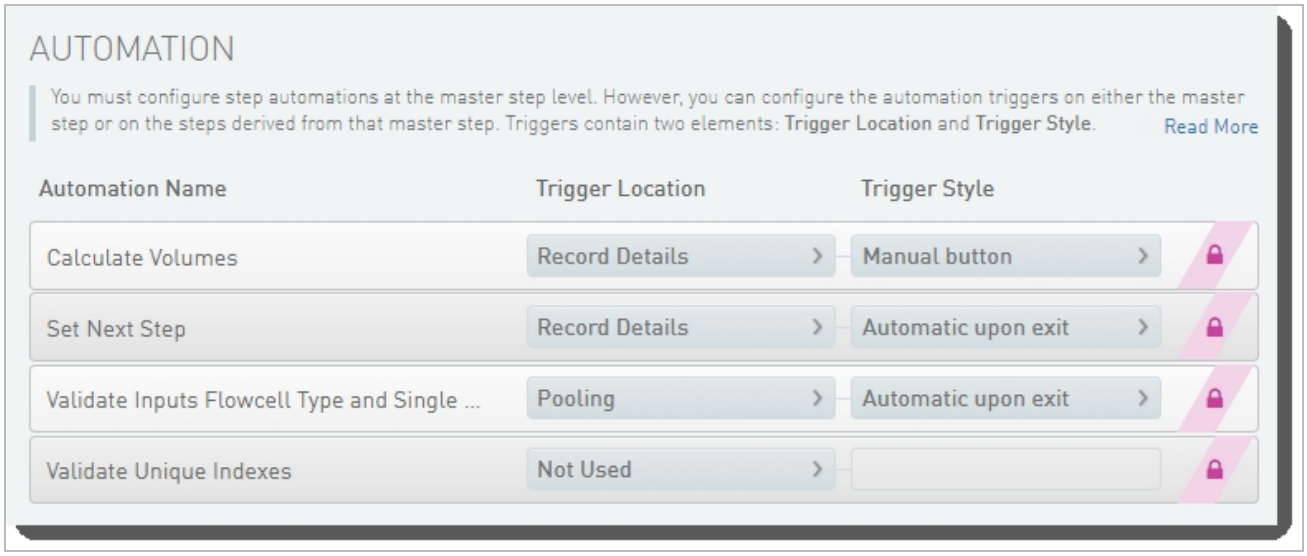
In this step, user manually places libraries into a pool.

User must only create one pool per step.



Step input: NTP (normalized libraries)

Step output: Bulk pool



The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes *(Not used. This functionality is handled by the core LIMS configuration for pooling.)*

Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool

Automatically triggered on exit of the Pooling screen, this automation:

- Checks that all samples in the pool have the same Flowcell Type assigned to them.
- Checks that only one pool has been created.
- Changes the value of error and logging messages to reference the type of pool passed as 'bulk' pool.

```
/opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar \script:validate_flowcell_for_input_pools \
```

```
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSingleOutput true \
  -poolType bulk"
```

Calculate Volumes

Automatically triggered when the user clicks the Calculate Volumes button on the Record Details screen, this automation:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (ul) field,based on the selected Flowcell Type:

```
if ( input.::Flowcell Type:: == ::SP:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Lanes to Sequence:: * 18 + 30
} ;
if ( input.::Flowcell Type:: == ::S1:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Lanes to Sequence:: * 18 + 30
} ;
if ( input.::Flowcell Type:: == ::S2:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Lanes to Sequence:: * 22 + 30
} ;
if ( input.::Flowcell Type:: == ::S4:: ) {
  step.::Bulk Pool Volume (ul):: = step.::Number of Lanes to Sequence:: * 30 + 30
} ;
```

- Calculates the Per Sample Volume (ul) to be added to the pool:

```
input.::Per Sample Volume (ul)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (ul)::)
/ step.::Number of Samples in Pool::
```

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (ul) value must be equal to or higher than the Minimum Per Sample Volume (ul) (default value set at5, may be edited by the user).

Assuming the default Minimum Per Sample Volume (ul) value of 5, for a given batch:

1. If the smallest Per Sample Volume (ul) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (ul) field.
2. The LIMS then adjusts the Adjusted Per Sample Volume (ul) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (ul) field value:

```
step.::Total Sample Volume (ul):: = step.::Total Sample Volume (ul):: +
input.::Adjusted Per Sample Volume (ul)::
```

- If the Total Sample Volume is less than the Bulk Pool Volum e, calculates the RSB Volume (ul) field value:

```
if (step.::Total Sample Volume (ul):: >= step.::Bulk Pool Volume (ul)::)
{output.::RSB Volume (ul):: = 0} else {output.::RSB Volume (ul):: = step.::Bulk
Pool Volume (ul):: - step.::Total Sample Volume (ul)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

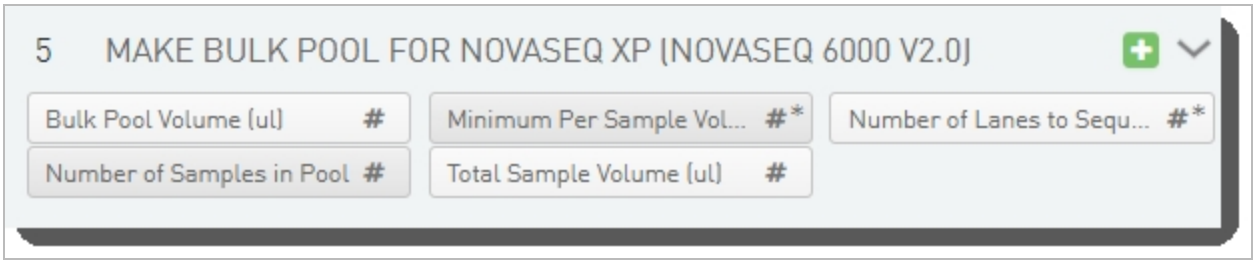
```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Bulk_Pool.csv and NovaSeq_Xp_Bulk_Pool2.csv template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download by the user on the Step Setup screen of the following step - Dilute, Denature and ExAmp (NovaSeq 6000 v3.0).

```
&& /opt/gls/clarity/bin/java \-jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool.csv \
  -o {compoundOutputFileLuid0}.csv \ script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Bulk_
Pool2.csv \
  -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation:



- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

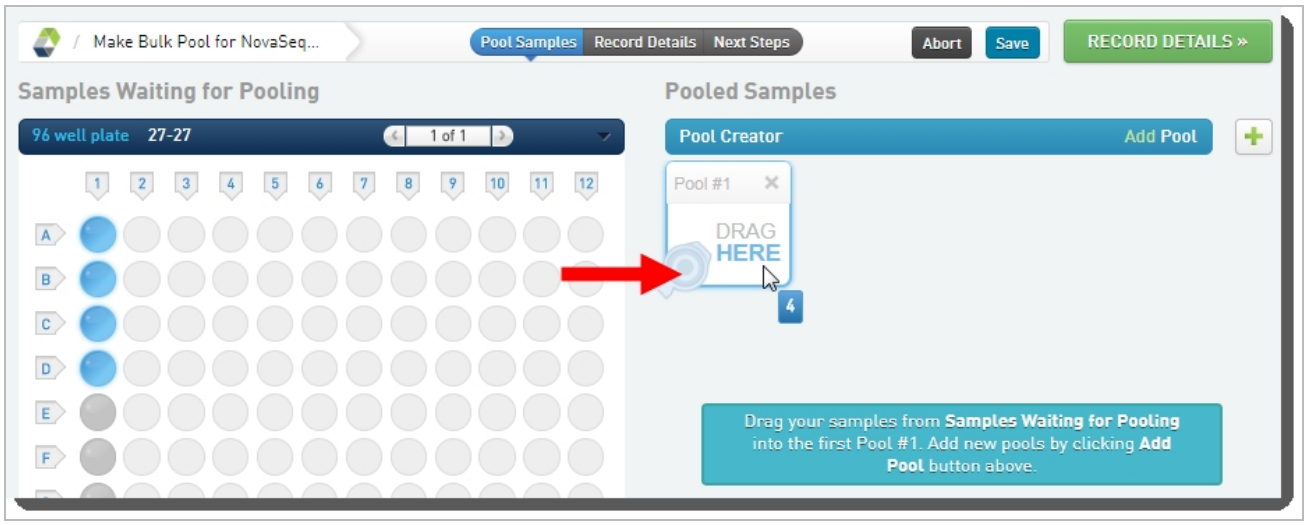
Step UDFs/Custom Fields

There are five fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step.

These are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

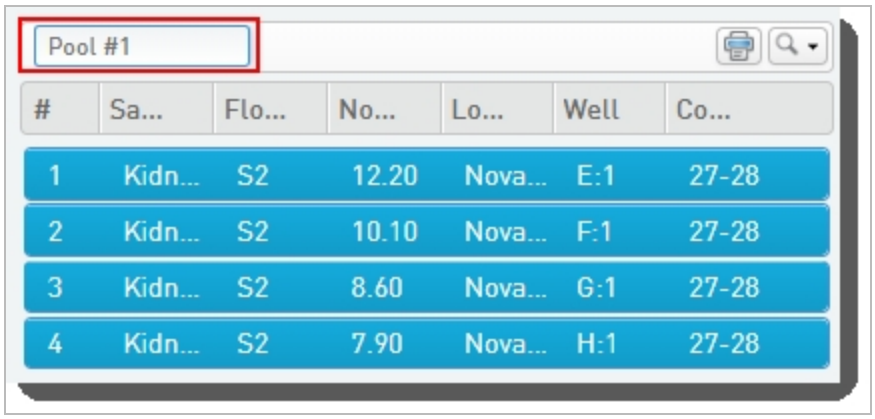
See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Bulk Pool Volume (ul) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Decimal Places Displayed: 2
Number of Lanes to Sequence	Numeric	• Required: Yes • Read Only: No	• Decimal Places Displayed: 0
Total Sample Volume (ul) (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0
Minimum Per Sample Volume (uL)	Numeric	• Required: Yes • Read Only: No	• Default: 5 • Decimal Places Displayed: 2
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric	• Required: No • Read Only: No	• Default: 0 • Decimal Places Displayed: 0



Global UDFs/Custom Fields

The following table lists the global UDFs/custom fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step:

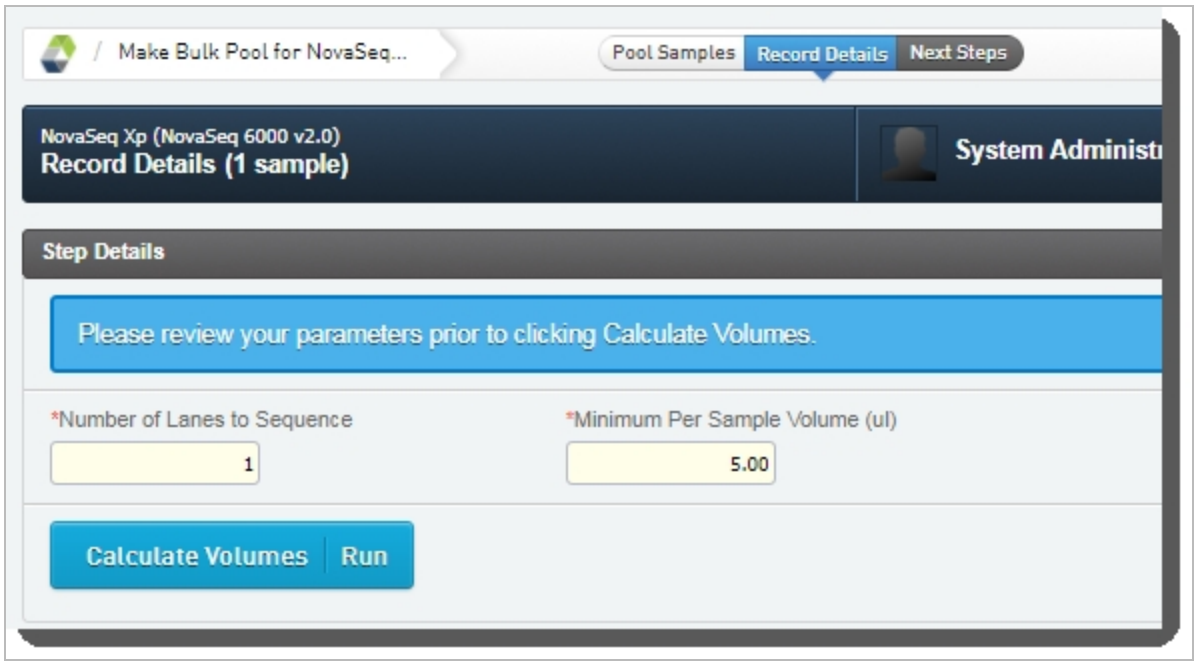


Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Samplein LIMS v5.x:			
RSB Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

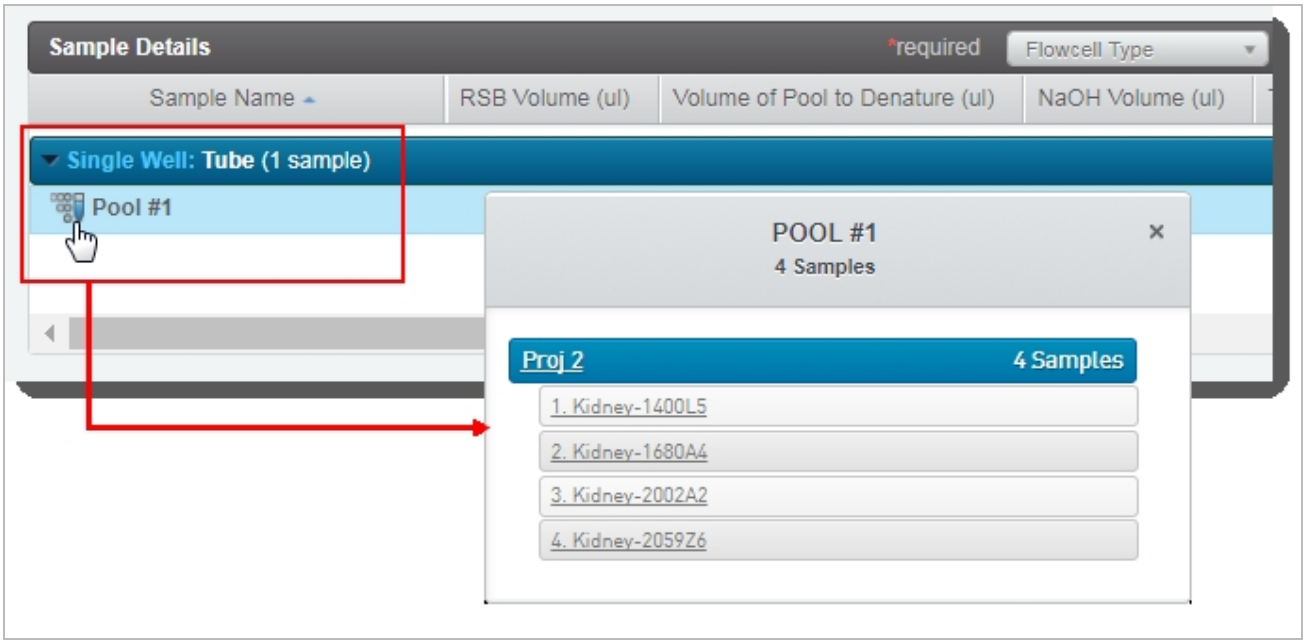
1. On the Queue screen, user adds samples of the same Flowcell Type to the Ice Bucket and clicks View Ice Bucket.
2. On the Ice Bucket screen, user clicks Begin Work.
3. On the Pooling screen, user:
    - Drags samples over into the Pool Creator to create a pool.

    - Names the pool, or accepts the default name - Pool #1.



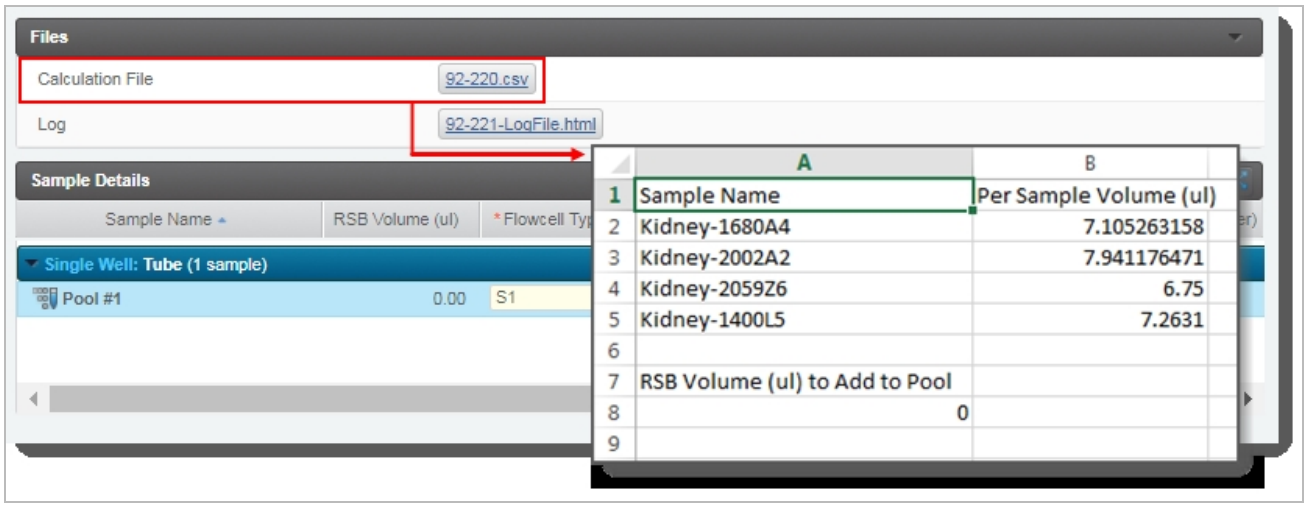
- Clicks Record Details.

On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type, and only one pool has been created.



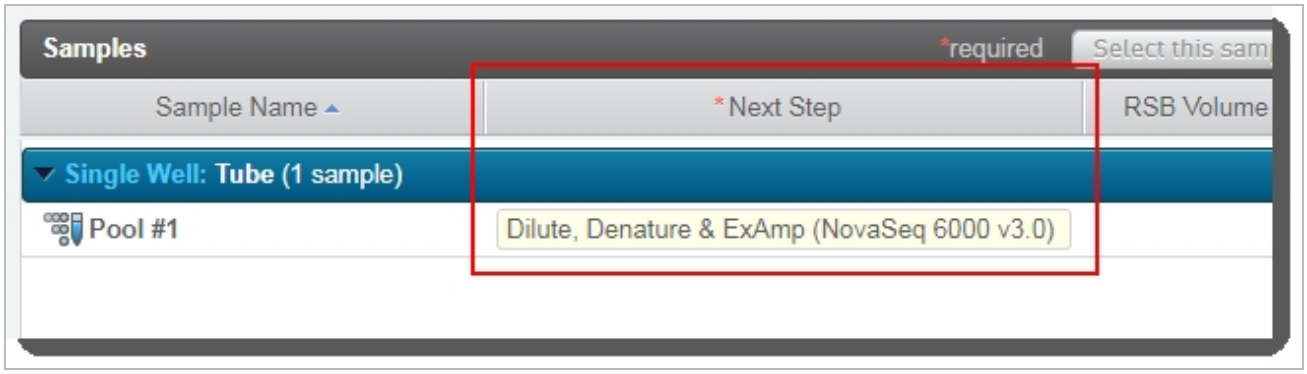
4. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Lanes to Sequence: The value entered in this field is used in volume calculations, to ensure that volumes are sufficient for the number of times the pool will be sequenced.
   - Minimum Per Sample Volume (ul): In many applications, and particularly where robotics are used, a minimum sample volume is required. The value in this field is used to calculate how much of each sample will be included in the pool.

   The field is pre-populated with the configured default value, 5 ul, but may be edited if required.



For Research Use Only. Not for use in diagnostic procedures.

- In the Sample Details table, the user can click on the pool icon to view details on the pool composition.



- The user clicks Calculate Volumes. This triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type: Calculates Bulk Pool Volume (ul) value.
  - Calculates the Per Sample Volume (ul) value to be added to the pool.
  - Calculates the Total Sample Volume (ul) value.
  - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (ul) value.
  - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
  - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool.The user can click on the file to download it, and then open it in Excel.

– The user clicks Next Steps. This triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute, Denature and ExAmp (NovaSeq 6000 v3.0).

5. On the Assign Next Steps screen:

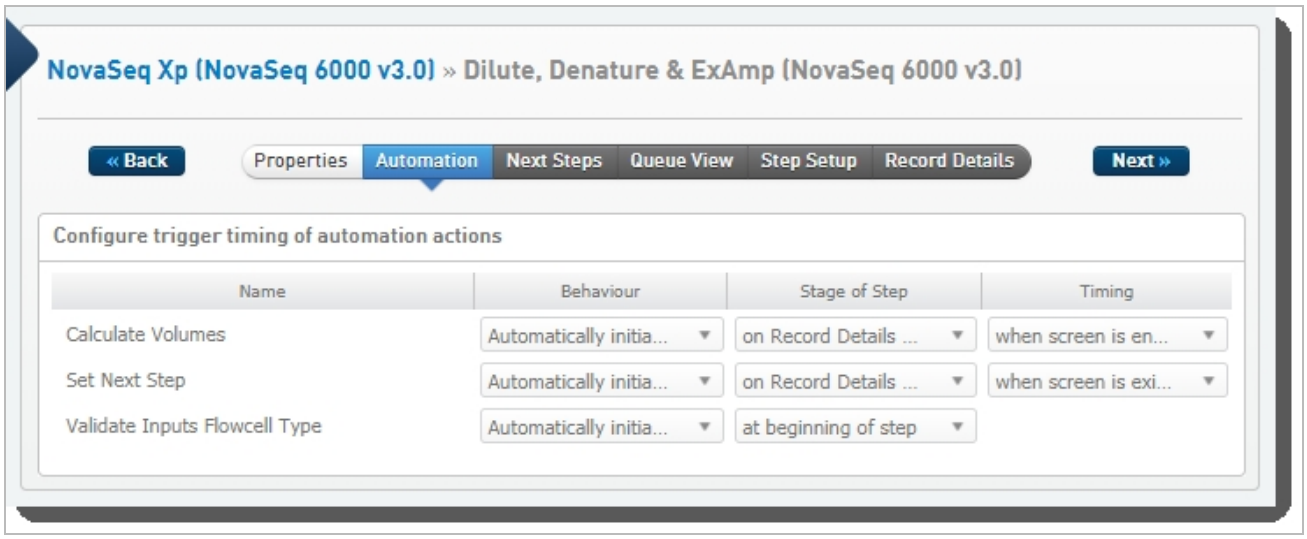
- The next step is already set to Dilute, Denature and ExAmp (NovaSeq 6000 v3.0).

- User clicks Finish Step. At the end of this step, the pool of samples automatically advances to the Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) step.

Step 2: Dilute, Denature and ExAmp (NovaSeq 6000 v3.0)

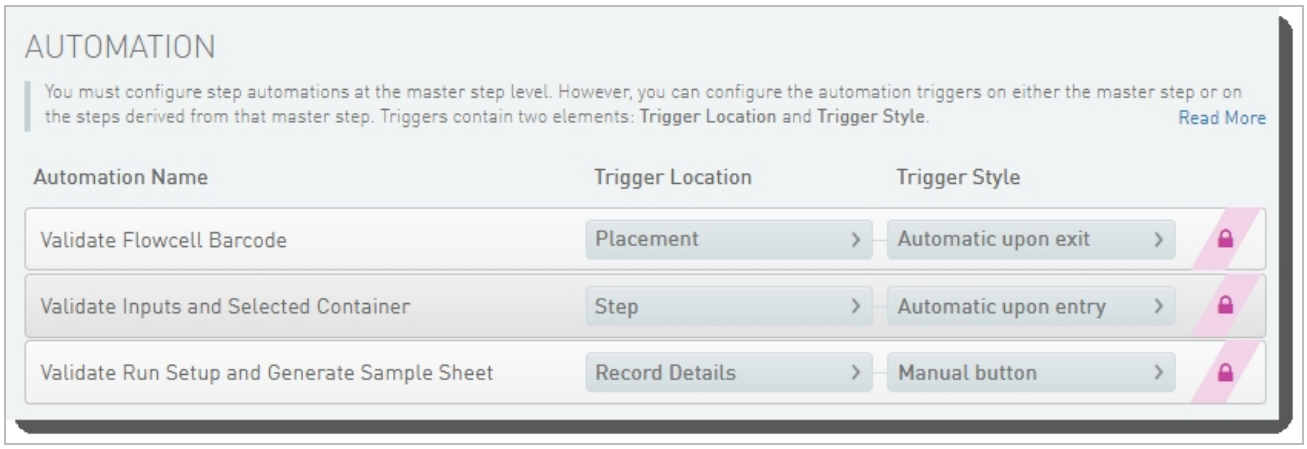
In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. The user manually creates working pools based on the number of lanes they want to sequence.

Step input: Bulk pool



Step output: Working pool - variable number, the user chooses how many working pools to create per bulk pool

The following automations are configured on the step:



- Calculate Volumes
- Set Next Step

- Validate Inputs Flowcell Type

Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Validate Inputs Flowcell Type

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools script. This script does the following:

- Checks the inputs to the step and validates that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4), and that all inputs have the same value for this field.
- The container type selected matches the value in the Flowcell Type field.
- Validates that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs the user that the number of working pools does not match the number of lanes available on the flow cell.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1}"
```

Calculate Volumes

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields, based on the Flowcell Type:

- BP Aliquot Volume (ul)
- NaOH Volume (ul)
- Tris-HCl Volume (ul)
- DPX1 Volume (ul)
- DPX2 Volume (ul)
- DPX3 Volume (ul)
- Mastermix per Lane (ul)

```
'if ( input.::Flowcell Type:: == ::SP:: ) {
  output.::BP Aliquot Volume (ul):: = 18 ;
  output.::NaOH Volume (ul):: = 4.50 ;
  output.::Tris-HCl Volume (ul):: = 4.50 ;
  step.::DPX1 Volume (ul):: = 126 ;
  step.::DPX2 Volume (ul):: = 18 ;
  step.::DPX3 Volume (ul):: = 66 ;
  output.::Mastermix per Lane (ul):: = 63};
if (input.::Flowcell Type:: == ::S1::) {
  output.::BP Aliquot Volume (ul):: = 18;
  output.::NaOH Volume (ul):: = 4.50;
  output.::Tris-HCl Volume (ul):: = 4.50;
  step.::DPX1 Volume (ul):: = 126;
  step.::DPX2 Volume (ul):: = 18;
  step.::DPX3 Volume (ul):: = 66;
  output.::Mastermix per Lane (ul):: = 63};
if (input.::Flowcell Type:: == ::S2::) {
  output.::BP Aliquot Volume (ul):: = 22;
  output.::NaOH Volume (ul):: = 5.50;
  output.::Tris-HCl Volume (ul):: = 5.50;
```

For Research Use Only. Not for use in diagnostic procedures.

```
  step.::DPX1 Volume (ul):: = 126;
  step.::DPX2 Volume (ul):: = 18;
  step.::DPX3 Volume (ul):: = 66;
  output.::Mastermix per Lane (ul):: = 77};
if (input.::Flowcell Type:: == ::S4::) {
  output.::BP Aliquot Volume (ul):: = 30;
  output.::NaOH Volume (ul):: = 7.50;
  output.::Tris-HCl Volume (ul):: = 7.50;
  step.::DPX1 Volume (ul):: = 315;
  step.::DPX2 Volume (ul):: = 45;
  step.::DPX3 Volume (ul):: = 165;
  output.::Mastermix per Lane (ul):: = 105
};
```

The automation also:

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

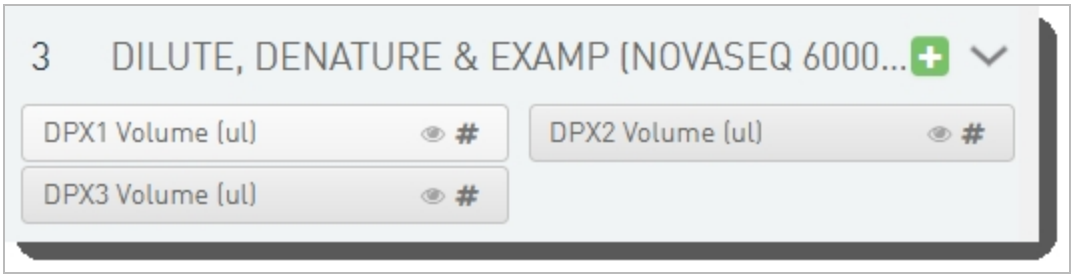
```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the NovaSeq_Xp_Working_Pool.csv and NovaSeq_Xp_Working_Pool2.csv template files to generate a single CSV file containing information about the DPX volume, and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download by the user on the Step Setup screen of the following step - Load to Flowcell (NovaSeq 6000 v3.0).

```
and /opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar \
 -i {stepURI:v2} \
 -u {username} \
 -p {password} \
 -l {compoundOutputFileLuid1} \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool.csv \
 -o {compoundOutputFileLuid0}.csv \script:driver_file_generator \
 -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_Xp_Working_
Pool2.csv \
 -o append.csv \
&& cat append.csv >> {compoundOutputFileLuid0}.csv"
```

Set Next Step

Automatically triggered on exit of the Record Details screen, this automation:



- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Step UDFs/custom fields

There are 3 fields defined on the Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) step. (These field values are set by a script and are not editable by the user running the step.)

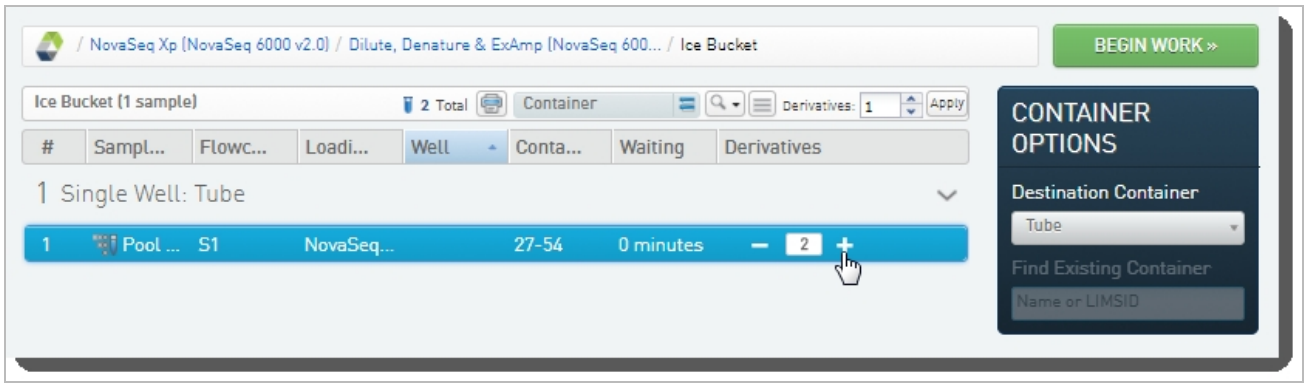
The fields are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
DPX1 Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX2 Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
DPX3 Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0

Global UDFs/Custom Fields

The following table lists the global UDFs/custom fields that are configured to display on the Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) step:



Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Sample in LIMS v5.x:			

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
BP Aliquot Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 0
NaOH Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2
Tris-HCl Volume (ul)	Numeric	• Required: No • Read Only: Yes	• Decimal Places Displayed: 2

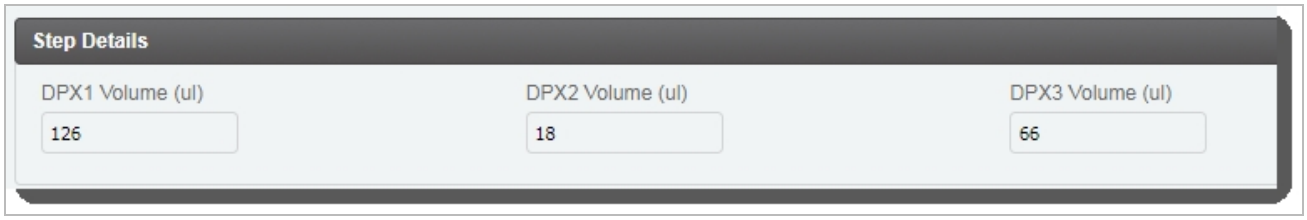
User Interaction

1. On the Queue screen, user adds the pool to the Ice Bucket and clicks View Ice Bucket.
2. On the Ice Bucket screen, user (optionally) sets the number of derivatives to create - these will be placed into the flow cell lanes, and clicks Begin Work.

On entry to the Record Details screen, the Calculate Volumes automation is triggered. This automation sets the following values based on the selected Flowcell Type (calculation details are provided inCalculate Volumes automation section, above):

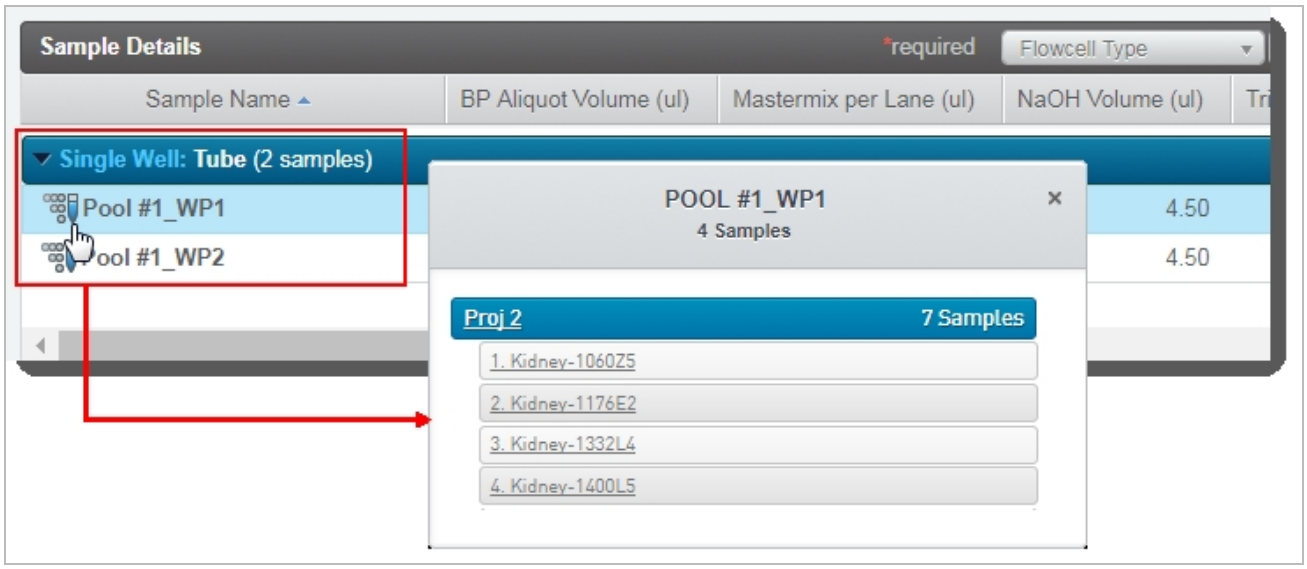
- BP Aliquot Volume (ul)

For Research Use Only. Not for use in diagnostic procedures.

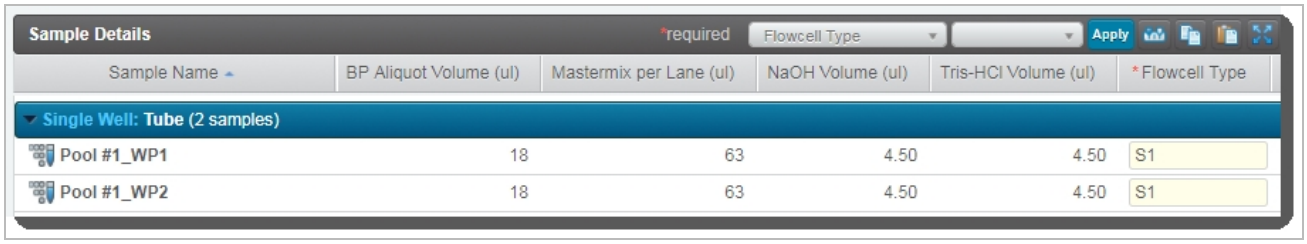


- NaOH Volume (ul)
- Tris-HCl Volume (ul)
- DPX1 Volume (ul)
- DPX2 Volume (ul)
- DPX3 Volume (ul)
- Mastermix per Lane (ul)
- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume, and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool. The user can click on the file to download it and then open it in Excel.

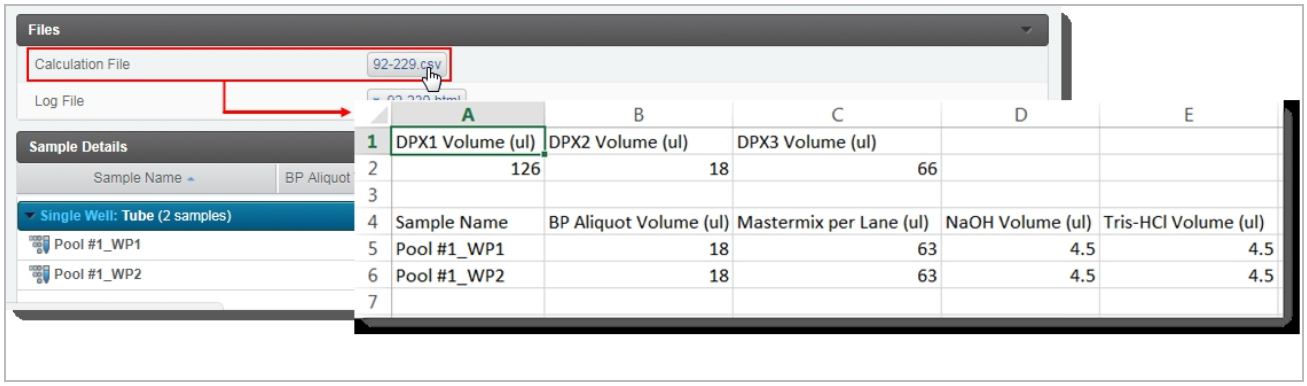
3. On the Record Details screen: The Reagent Lot Tracking section lets you track the DPX1, DPX2, DPX3, NaOH, RSB, and Tris-HCl reagent lots. The user selects from the active lots displayed in each drop-down list.



To make reagent lots available for selection in the Reagent Lot Tracking section, you must first configure and activate them. You can do this on the Reagents and Controls screen (LIMS v4.2.x) or the Configuration > Consumables screen (LIMS v5.x).

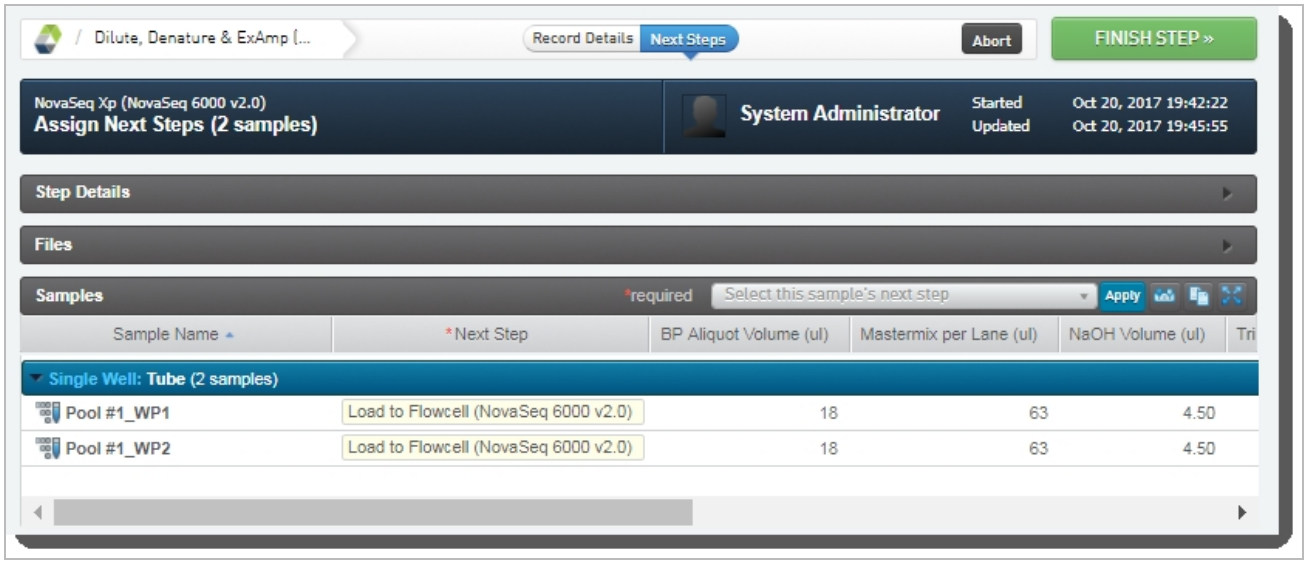


- In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. (These values are set by a script and are not editable by the user running the step.)



- In the Sample Details table:
  - The user can click on the pool icon to view details on the working pool composition.

- The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCI volume values for each working pool are already populated. (These values are set by a script and are not editable by the user running the step.)
- The working pool number is appended to the bulk pool name. This allows users to quickly identify which working pools are derived from the same bulk pool.



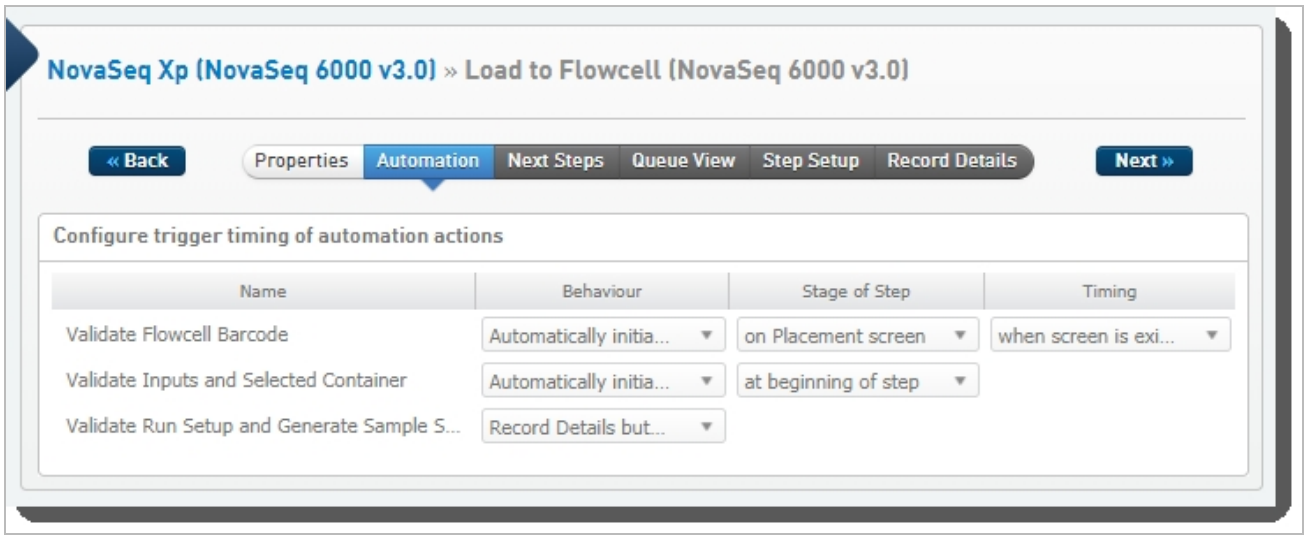
- In the Files area, the user can click on the Calculation File (CSV) file to download it and then open it in Excel to view information about the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool.

- User clicks Next Steps, which triggers the Set Next Step automation (described above).

4. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.0). User clicks Finish Step.

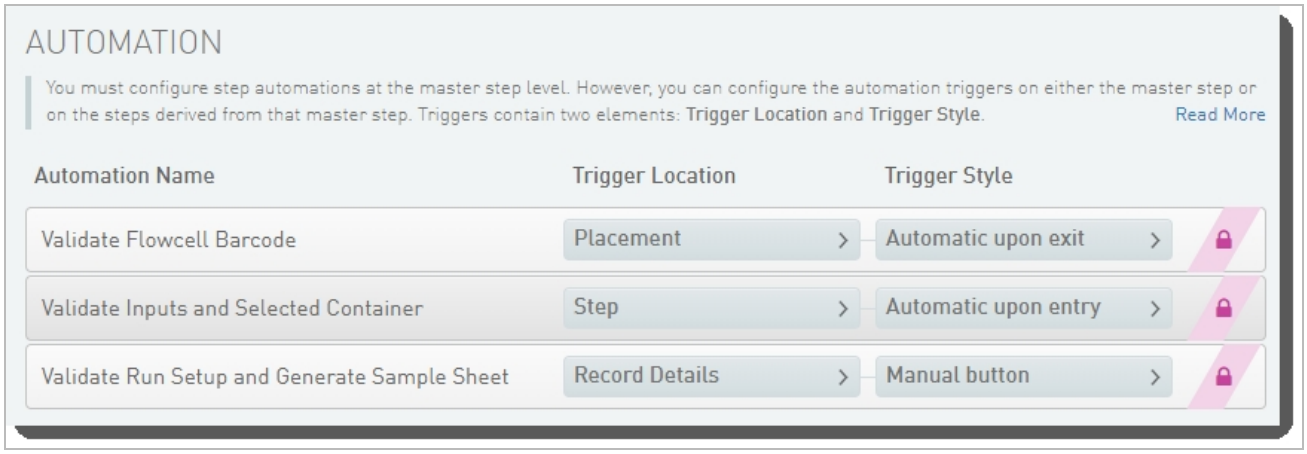
Step 3: Load to Flowcell (NovaSeq 6000 v3.0)

In this step, the user scans the flow cell barcode into the LIMS, and then manually places the working pools into the lanes of the flow cell that will be used in the NovaSeq run. In addition, this step validates the run setup information and generates the sample sheet file.



Step input: Working pool

Step output: Flow cell (output containers: SP, S1, and S2 with 2 lanes, and S4 with 4 lanes)



The following automations are configured on the step:

- Validate Run Setup and Generate Sample Sheet
- Validate Flowcell Barcode
- Validate Inputs and Selected Container

Load to Flowcell (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

Load to Flowcell (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

These automations are described below, in the order in which they are triggered at run time.

Validate Inputs and Selected Container

Automatically triggered at the beginning of the step, this automation invokes the validate_flowcell_for_input_pools and validateSelectedContainer scripts. These scripts validate the step inputs and the container selected by the user, as follows:

- Check that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4), and that all inputs have the same value.
- Check that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs the user that the number of working pools does not match the number of lanes available on the flow cell.
  The following table defines the number of samples allowed:

Flow Cell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Check that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, displays an error message.

```
bash -l -c "/opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar
\script:validate_flowcell_for_input_pools \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
  -l {compoundOutputFileLuid1} \
  -validateSelectedContainer true"
```

Validate Flowcell Barcode

Automatically triggered on exit of the Placement screen, this automation:

- Validates the flow cell barcode scanned into the LIMS by the user, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches( ::[A-Za-
z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches( ::[A-Za-
z0-9]{5}DRXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches( ::[A-Za-
z0-9]{5}DMXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ; \
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches( ::[A-Za-
z0-9]{5}DSXX:: ) ) { \
  fail ( ::Invalid Flowcell Barcode. Please verify and try again.:: ) \
} ;
```

- Copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; \
output.::Loading Workflow Type:: = input.::Loading Workflow Type::'
```

For Research Use Only. Not for use in diagnostic procedures.

Validate Run Setup and Generate Sample Sheet

Automatically triggered when user clicks a button on the Record Details screen, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen, which will be used to set up the run and generate the sample sheet file. (See *Respond to Validation/Recipe Request Call from Sequencer* on page 863 section, below.)
  - Experiment Name may only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type = No Index, Index Read 1 must be zero. For any other Workflow Type, Index Read 1 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) { \
  fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::) \
}; \
if(step.::Workflow Type::== ::No Index::) { \
  if(step.::Index Read 1::!= 0) { \
    fail(::Index Read 1 must be 0 if the Workflow Type is No Index.::) \
  } \
} else { \
  if(step.::Index Read 1::== 0) { \
    fail(::Index Read 1 must be greater than 0 if the Workflow Type is ::+
step.::Workflow Type::+ ::.::) \
  } \
};
```

- Checks the Paired End and Read 2 Cycles field values.
  - If Paired End = False, sets Read 2 Cycles value to 0.
  - If Paired End= True and 2 Cycles value is 0, generates an error.

```
if (!step.::Paired End::.toBoolean()) {
  step.::Read 2 Cycles:: = 0 \
}; \
if (step.::Paired End::.toBoolean() && step.::Read 2 Cycles:: == 0) \{ \
  fail(::Read 2 Cycles must not be zero if it is Paired End read.::) \
};
```

- Checks the Workflow Type and Read 2 Cycles field values.
  - If Workflow Type is set to Dual Index and Index Read 2 value is 0, generates an error.
  - If Workflow Type is set to No Index or Single Index, sets Index Read 2 to 0.

```
if (step.::Workflow Type:: == ::Dual Index:: && step.::Index Read 2:: == 0) {
```

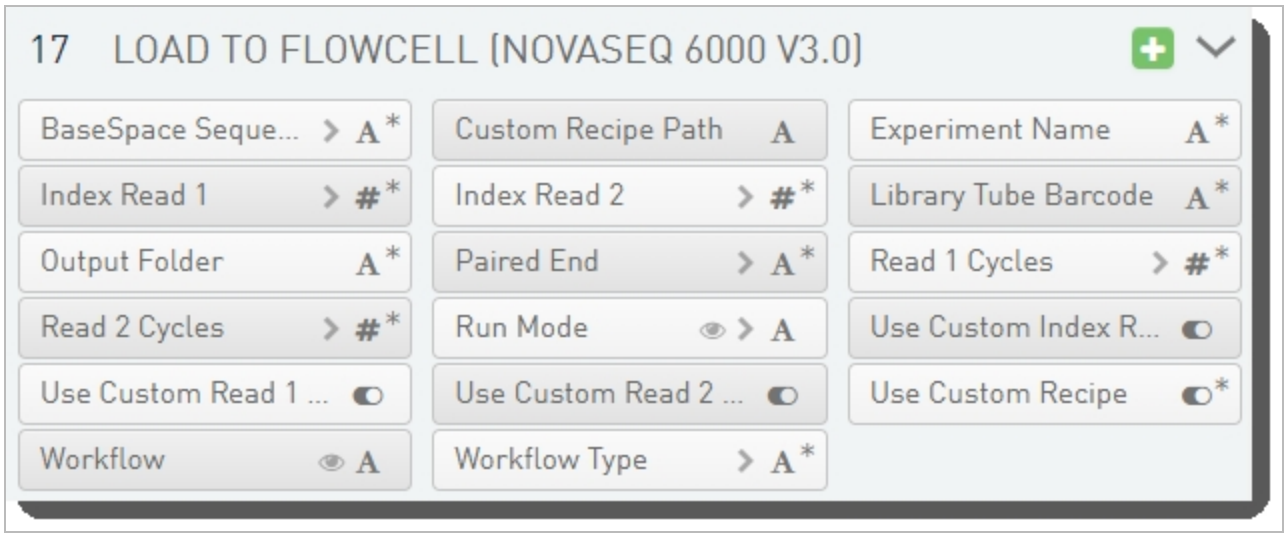
```
  fail(::Index Read 2 must not be zero if Workflow Type is Dual Index.::)
};
if (step.::Workflow Type:: == ::No Index:: || step.::Workflow Type:: == ::Single
Index::) {
  step.::Index Read 2:: = 0
};
```

- Copies the Flowcell Type value from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
```

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - AUTOMATED - Run (NovaSeq 6000) v3.0.

```
nextStep = ::ADVANCE::
```



- Generates the sample sheet and attaches it to the step (see *Sample Sheet Generation* on page 861, below).

```
&& /opt/gls/clarity/bin/java \
-jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/DriverFileGenerator.jar \
  -i {stepURI:v2} \
  -u {username} \
  -p {password} \
script:driver_file_generator \
  -t /opt/gls/clarity/extensions/conf/driverfiletemplates/NovaSeq_BCL2FASTQ_
Samplesheet.csv \
  -o {compoundOutputFileLuid0}.csv \
  -q true \
  -destLIMSID {compoundOutputFileLuid0} \
-l {compoundOutputFileLuid1}"
```

Step UDFs/Custom Fields

There are 17 fields defined on the Load to Flowcell (NovaSeq 6000 v3.0) step.

These are shown below in the BaseSpace Clarity LIMS v5.x Configuration area (Custom Fields > Master Step Fields tab).

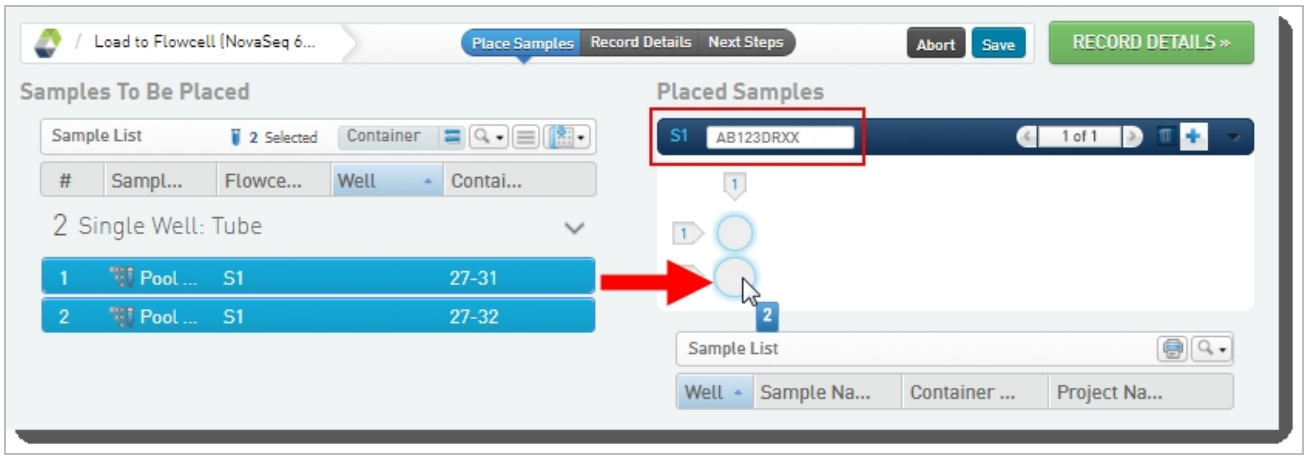
See the following table for LIMS v4.2.x and LIMS v5.x field configuration details:

Field Name	Field Type	Field Contraints/Options	Preset Values/Additional Options and Dropdown Items
BaseSpace Sequence Hub Configuration	Check Box (v4.2.x) Toggle Switch (v5.x)	• Required: Np • Read Only: No	• Default: None Set
Use Custom Recipe	Check Box (v4.2.x) Toggle Switch (v5.x)	• Required: Yes • Read Only: No	• Default: No
Workflow	Single-line Text (v4.2.x) Text (v5.x)	• Required: No • Read Only: Yes	• GenerateFASTQ
Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• No Index • Single Index • Dual Index • Custom

Global UDFs/Custom Fields

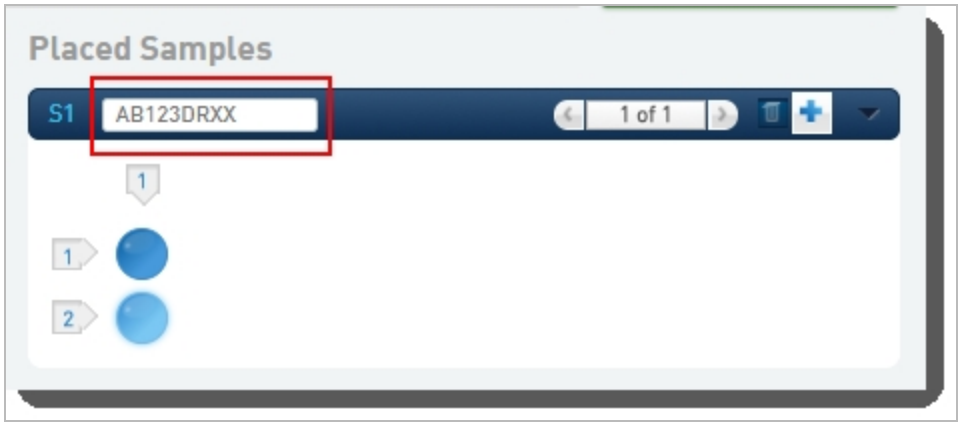
The following table lists the global UDFs/custom fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v3.0) step.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Configured on Analyte in LIMS v4.2.x and Derived Sample in LIMS v5.x:			



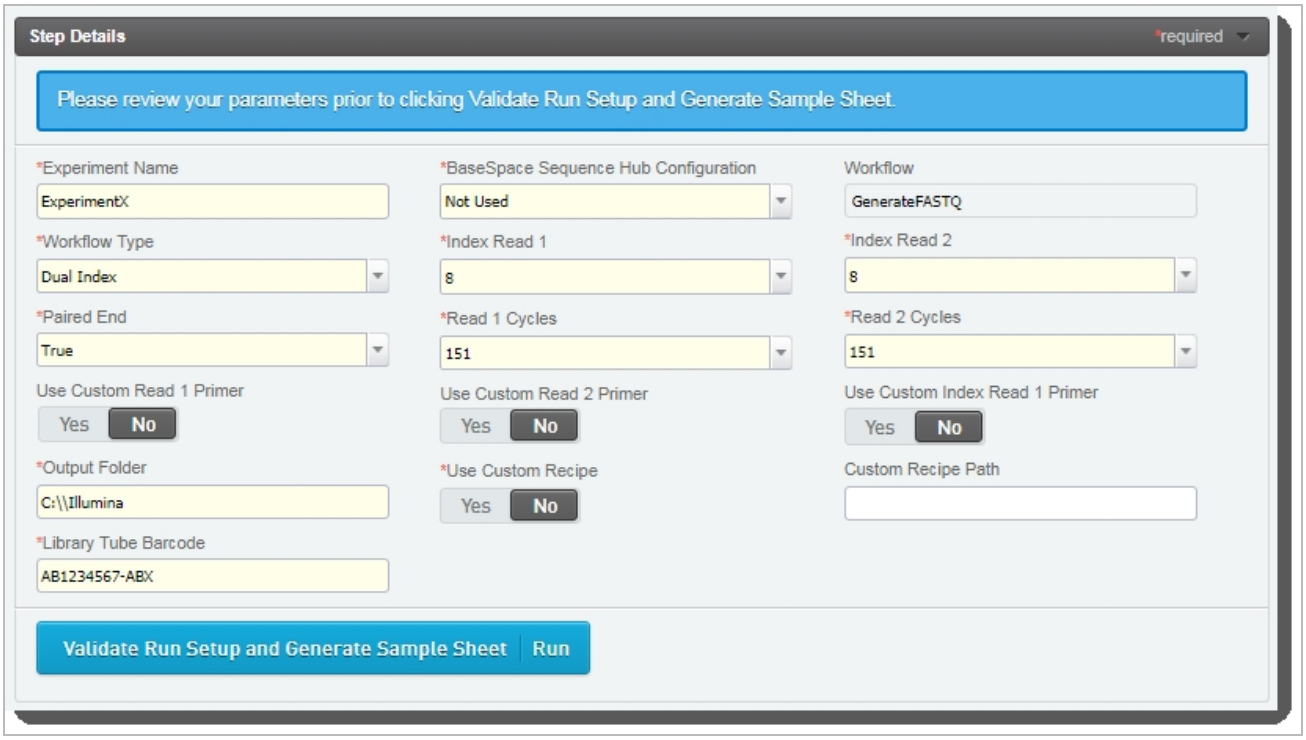
Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Dropdown Items
Flowcell Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• SP • S1 • S2 • S4
Loading Workflow Type	Single-line Text (v4.2.x) Text Dropdown (v5.x)	• Required: Yes • Read Only: No • Custom Entries: No	• NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction



1. On the Ice Bucket screen, user:
    - Selects the appropriate flow cell type from the Destination Container drop-down list in the Container Options panel.

    - Clicks Begin Work.
2. On the Placement screen, user:
    - Drags the pool(s) from the left of the screen over into the Placed Samples area on the right.

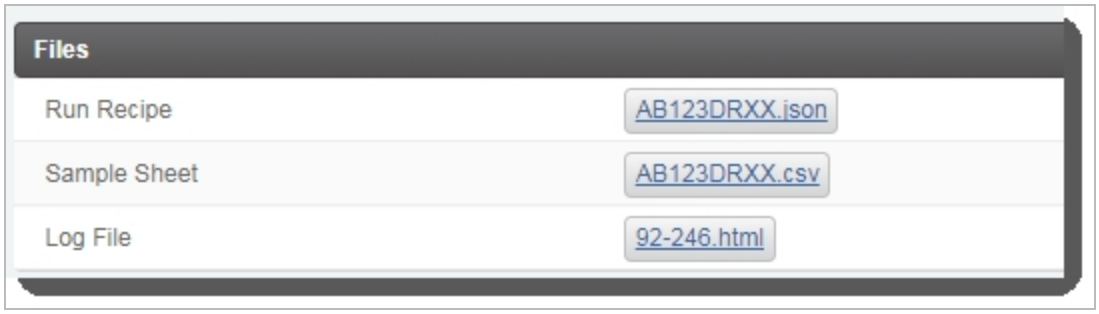


- Scans or types the barcode of the flow cell into the flow cell field.

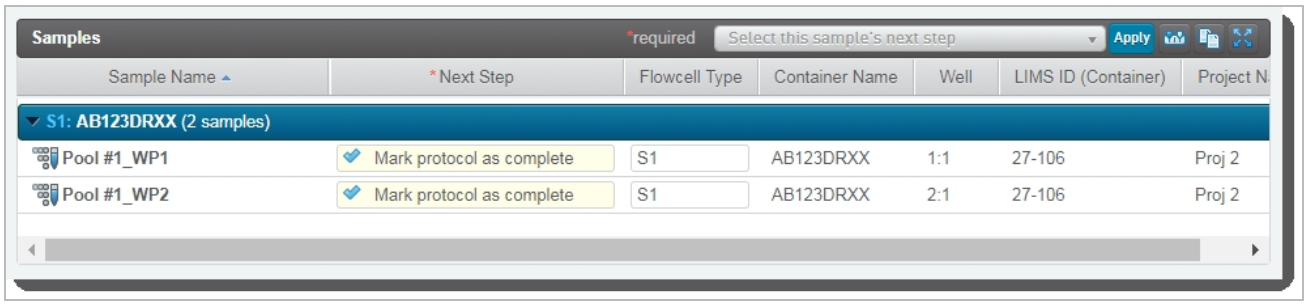
- Clicks Record Details.

  On exit of the Placement screen, the Validate Flowcell Barcode automation validates the container barcode (described above).

3. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet file.



Some of these fields are auto-populated and some must be completed by the user (see the following table for details):



Field	Value
Experiment Name	User enters the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	User selects from preset options: Not Used, Run Monitoring Only, Run Monitoring and Storage
Workflow	Automatically populated with preset - GenerateFASTQ
Workflow Type	User selects from preset options: No Index, Single Index, Dual Index, Custom
Index Read 1	User selects from preset options: 0, 6, 8 - or type a value between 0 and 20
Index Read 2	User selects from preset options: 0, 6, 8 - or type a value between 0 and 20
Paired End	User selects from preset options: True or False
Read 1 Cycles	User selects from preset options: 251, 151, 101, 51 - or type a value between 1 and 251 Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.

Field	Value
Read 2 Cycles	User selects from preset options: 251, 151, 101, 51 - or type a value between 1 and 251 Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	User selects if applicable.
Use Custom Read 2 Primer	User selects if applicable.
Use Custom Index Read 1 Primer	User selects if applicable.
Output Folder	User enters the network path for sequencing run folder. For example: \\networkshare\run_data
Use Custom Recipe	User selects if applicable.
Custom Recipe Path	If Use Custom Recipe selected, user enters the path to the custom recipe file to be used.
Library Tube Barcode	User scans the library tube barcode.

4. On the Record Details screen, user clicks Validate Run Setup and Generate Sample Sheet. This triggers the automation script, which does the following:
    - Validates the information provided to set up the run.
    - Generates the sample sheet file and attaches it to the placeholder in the Files area of the Record Detailsscreen.

5. User clicks Next Steps.
6. On the Assign Next Steps screen, the Next Step field for all samples is pre-populated with Mark protocol as complete. User clicks Finish Step.

7. In Lab View, the pooled samples are queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step and data from the run is parsed back into the LIMS.

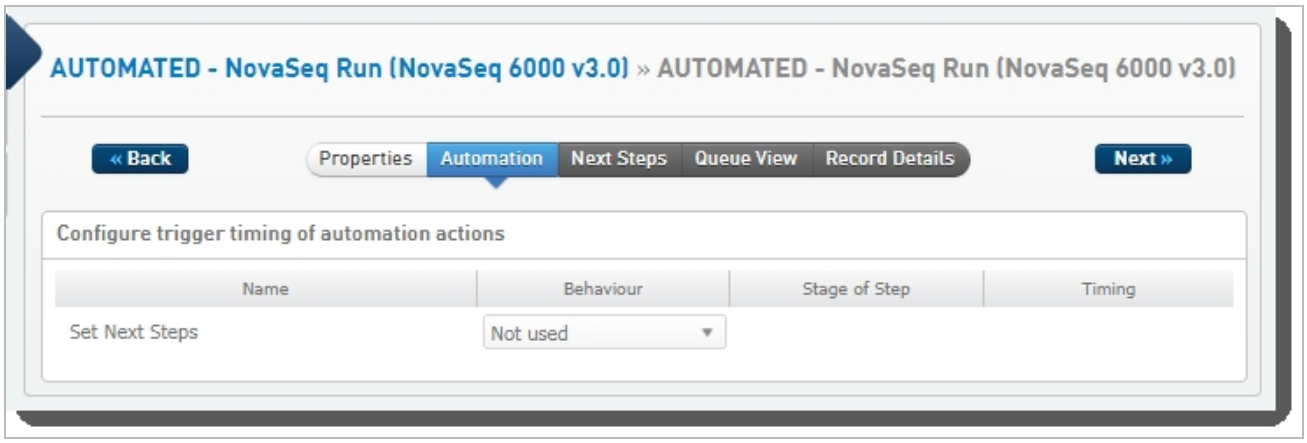
Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)

This final protocol contains one fully-automated step, AUTOMATED- NovaSeq Run (NovaSeq 6000 v3.0), described below.

> This is a fully-automated step. The user must not add samples to the Ice Bucket or start the step manually.

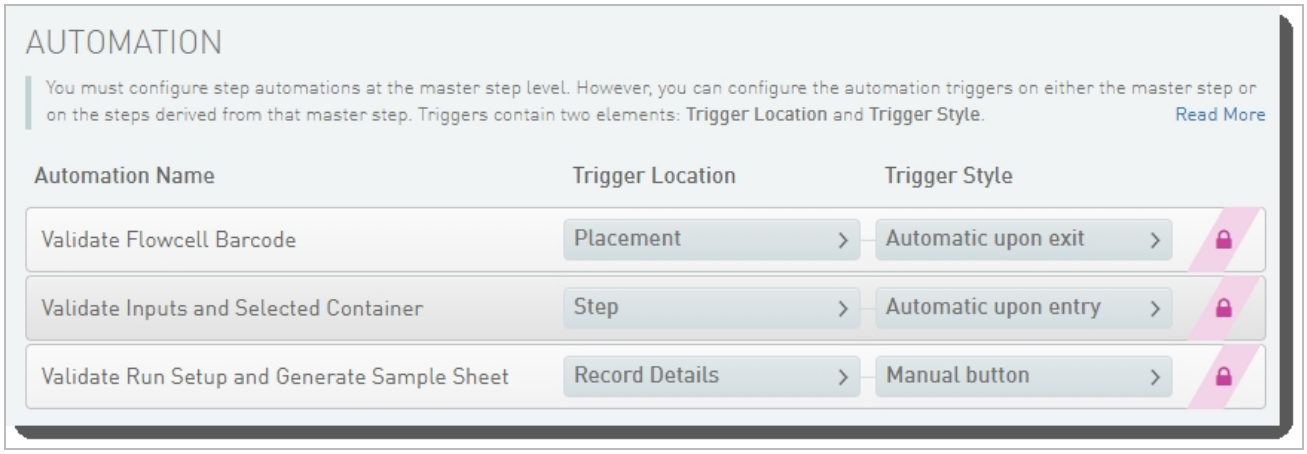
Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)

Step input: Library tube from NovaSeq Standard or flow cell from NovaSeq Xp protocol



Step output: Result file/measurement

> The user must not start this step. This is a fully-automated step and the sequencing service will not update samples correctly if they have been manually started.



In this step, pooled samples are sequenced on the NovaSeq instrument and the run metrics are recorded in the LIMS.

The Set Next Steps automation is the only automation configured on this step. By default, this automation is disabled (set to Not Used) and the Sequencer API is used to set the next step for samples.

AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) automation configuration - LIMS v4.2.x:

AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) automation configuration - LIMS v5.x:

If required, you can override the default next step behavior used by the Sequencer API. To do this:

1. Enable the automation and use it to set custom next step behavior and generate a log file. By default, the automation will set the next step to ADVANCE and the samples complete the protocol.
2. Configure the automation to be triggered automatically on exit of the Record Details screen.

- If you do not want to override the default next step behavior used by the Sequencer API, you can do one of the following:
  - Leave the Set Next Steps automation in place, but disabled at the step level - as configured in the out-of-the-box integration.
  - Delete the Set Next Steps automation.
- If you would like to override the default next step behavior used by the Sequencer API, you can do one of the following:
  - Enable the automation and use it to set custom next step behavior and generate a log file - as described above.
  - Disable/configure auto-complete behavior by setting the values of the run.autoComplete and autoCompleteOnlyAtSuccess properties. See *Configuring autoComplete Properties* on page 874 section, below.

For Research Use Only. Not for use in diagnostic procedures.

Step UDFs/Custom Fields

The following table shows how the run parameters parsed from the RunParameter.xml file map to step UDFs/custom fields configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step in the LIMS.

Run Parameter	Step UDF/Custom Field Name
currentCycle	Current Cycle
currentRead	Current Read
firmwareVersion	Firmware Version
FlowCellExpirationDate	Flow Cell Expiration Date
FlowCellId	Flow Cell ID
FlowCellLotNumber	Flow Cell Lot Number
FlowCellMode	Flow Cell Mode
FlowCellPartNumber	Flow Cell Part Number
FlowCellSide	Flow Cell Side
controlSoftwareVersion	Instrument Control Software Version
instrumentId	Instrument ID
instrumentType	Instrument Type
WorkflowType	Loading Workflow Type
OutputRunFolder	Output Folder
rtaVersion	RTA Version
RunId	Run ID
runStatus	Run Status
sequencingLog	Sequencing Log

Global UDFs/Custom Fields

The following global UDFs/custom fields are used to capture the run metrics in the LIMS.

- % Aligned R1
- % Aligned R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- % Error Rate R1
- % Error Rate R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1

- % Prephasing R2
- %PF R1
- %PF R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- Reads PF (M) R1
- Reads PF (M) R2
- Yield PF (Gb) R1
- Yield PF (Gb) R2

Note the following:

- Values are aggregated across all lanes. Some values - for example Yield PF (Gb) R1 - are summed, while others are averaged.
- The names listed above are the default UDF/global field names installed with the NovaSeq Integration v3.2.1 configuration provided in the Preconfigured Workflow Package (PCWP) v1.2 or later.
- All UDFs/global fields are configured on the Container entity.
- All field names are configurable via the LIMS Configuration > Custom Fields screen (Global Fields tab).
- If you change the field names in the LIMS, you must also change them through the run.metricUdfNames properties file in the application.yml file for the Sequencer API (see *application.yml Properties* on page 868). All fields are configured to be visible on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step's Record Details screen, in the Sample Details table.

- As these UDFs/fields are configured on the Container entity, they are visible on each input. However, they should not be confused with per-lane metrics.
- All run metrics tracked in the LIMS are overall metrics for the run; there are no per-lane metrics provided by NovaSeq at this time.

How the Sequencer API Integration Works

Sample Sheet Generation

The sample sheet is generated on the step prior to the run – Dilute and Denature (NovaSeq 6000 v3.0) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v3.0) in the NovaSeq Xp protocol. This is the step where samples are placed on the library tube or flow cell that will be loaded in the NovaSeq instrument.

In the out-of-the-box configuration, the *Validate Run Setup and Generate Sample Sheet* on page 851 automation generates one CSV format sample sheet file for use with bcl2fastq v2.20 downstream analysis.

How it Works

The sample sheet is uploaded to the NVCS via the /Illumina/Sequencer/v2/sequencing-run/files endpoint to the Sequencer API. The files endpoint allows for a file to be downloaded from the LIMS using OAuth (instead of Basic Authentication), which is required for NovaSeq.

The run recipe response sets the sample sheet URL to the link to download the file from this endpoint, and sets the sampleSheetRequiresOAuth value to true.

Sample Sheet Contents

The sample sheet content is controlled by the following step UDFs/master step fields that display in the Step Details area of the Record Details screen.

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow

See the *Bcl2fastq2 Sample Sheet Generation* article for detailed information on the following:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

NovaSeq Run

The steps below outline the sequence of events that occurs when a flow cell is loaded onto the NovaSeq instrument.

The LIMS tracks per-instrument sequencing runs by appending the instrument name to the Run ID field value.

If the InterOp data does not include an InstrumentName value, capturing of run metrics proceeds and a warning is logged. If the InterOp data does include an InstrumentName value, and multiple instruments with the same name exist in the LIMS, capturing of run metrics fails and an error is logged.

User Authentication and Login

User authentication and login to the NovaSeq instrument is achieved via the getSequencerLoginURL endpoint (found at /Illumina/Sequencer/v2/sequencing-run/login). This endpoint returns the URL that the sequencer uses to get an access token.

1. The Sequencer API service provides the NovaSeq Control Software (NVCS) with a URL for the LIMS login screen and the NVCS displays this screen to the user. When the user logs in, this automatically authorizes the NVCS to use their account to access the LIMS.
2. User enters credentials:
    - Username and password are passed to the Clarity LIMS server, to ensure the access is valid.
    - By default, the Sequencer API service tries to contact the LIMS at http://localhost:9080/clarity/. This URL is set by the installation script, but can be configured with the clarity.url property in the application.yml file (see *application.yml Properties* on page 868).
3. User is redirected to the Sequencer login page at /Illumina/Sequencer/v2/sequencer_login.
    - If authentication is successful, the screen displays a success message. The LIMS server provides the OAuth token and username by returning them in redirect to /Illumina/Sequencer/v2/sequencer_login/Success. This redirect does not reload the page, but allows the NovaSeq to continue with run setup.
    - If authentication fails, the user is left on the login screen and a warning message informs them of the failure. A background redirect to /Illumina/Sequencer/v2/sequencer_login/Error informs the NovaSeq of the failure.

Respond to Validation/Recipe Request Call from Sequencer

1. The sequencing-run/recipe/novaseq endpoint consumes a POST request with a LibraryContainerI, FlowCellId, and reagents information.
    - LibraryContainerId, FlowCellId, and reagents information are provided by the NovaSeq. LibraryContainerId is required.
    - LibraryContainerId and FlowCellId should match either the library tube ID or flow cell ID of the corresponding container(s) in the LIMS.
    - If there are no containers or multiple containers, an error is generated.
2. All populated containers whose name matches either the LibraryContainerId or FlowCellId are validated as follows:
    - All samples in the container must be queued for a sequencing run step.
    - All samples must be queued for only one sequencing run step.
    - All samples must be queued for the same sequencing run step.

You can configure the steps that are considered as 'sequencing run steps' in the novaseq.sequenceStepNames property in the application.yml file. The property is a list and each list entry must be the exact name of a sequencing step, not the name of the underlying master step/process type. See *application.yml Properties* on page 868.

3. Once a single container has passed validation, the run setup information (run recipe request) is returned to the NVCS via the API and the run recipe is generated.
   Note the following:

For Research Use Only. Not for use in diagnostic procedures.

- The run recipe information is read from fields configured on the parent process/master step of the samples in the container. The workflow must include recipe definition in that step.
- By default, the parent process/master step is the Dilute and Denature (NovaSeq 6000 v3.0) or Load to Flowcell (NovaSeq 6000 v3.0) step, depending on workflow.
- The default field values match the names of the fields in the NovaSeq v3.2.1 configuration included in PCWP. The field names are configurable through the recipe.udfNames.* properties. Each of these properties corresponds to a entry in the recipe and the value of a property defines the name of the field that is used to populate that entry in the recipe.
- It is assumed that this parent process/master step removes any illegal characters from the Experiment Name field.
- The LIMS download link to the sample sheet created on the run setup step is used for the SampleSheet value in the recipe. The name of the output of the sample sheet on the setup step can be configured through the recipe.sampleSheet.outputName property (Sample Sheet by default) in the application.yml (see *application.yml Properties* on page 868). If no matching output is found, or no file was attached to the output, then the value of the recipe.sampleSheet.notAvailableValue property (Not Available by default) is used in the recipe.

4. After the recipe is generated, it is returned as a *.json file in the response, in the form defined by the Swagger definition for the API.

Run Recipe Contents

The contents of the run recipe are controlled by the sample sheet contents and the step UDFs/master step fields, configured on the Dilute and Denature (NovaSeq 6000 v3.0) and Load to Flowcell (NovaSeq 6000 v3.0) steps:

Example of run recipe content is as follows:

```
{
  "run_name": "NVCS16027_SPrime_2x250",
  "run_mode": "S4",
  "workflow_type": "DualIndex",
  "librarytube_id": "NV0025867-LIB",
  "flowcell_id": "",
  "sample_loading_type": "NovaSeqStandard",
  "rehyb": false,
  "paired_end": true,
  "read1": 151,
  "read2": 151,
  "index_read1": 8,
  "index_read2": 8,
  "output_folder": "\\\\network_path\\run_data",
  "samplesheet": "<path to sample sheet on LIMS server>",
```

For Research Use Only. Not for use in diagnostic procedures.

```
  "require_samplesheet_authentication": true,
  "usecustomrecipe": false,
  "customRecipe": null,
  "use_basespace": false,
  "basespace_mode": null,
  "use_custom_read1_primer": false,
  "use_custom_read2_primer": false,
  "use_custom_index_read1_primer": false
}
```

Respond to Sequencing Started Call from Sequencer

1. Matching container for the run (library tube or flow cell) is found, and contents are validated to be queued for the correct step.

> An error is thrown and the step is not started if no matching container is found, or if the samples in the container are incorrectly queued. This validation is also done during the run recipe request immediately prior, so this error case should not be encountered.

2. Reagent kits that are configured for the Sequencer API are checked against the configuration for the step to be run:
    - If a kit is configured for the API but does not exist in LIMS, it is created.
    - If a kit exists, but is not enabled on the step to be run, the step configuration is updated to enable it
    - If a kit that is to be enabled is Archived, it is set to Active.
    - If a kit that is to be enabled is in Pending status, it is set to Active.
    - If any kits enabled on the step are not configured for the Sequencer API, a warning is logged and the step is unable to be completed by the API without user intervention.
    - If any kits provided in the recipe request are not configured for the Sequencer API, they are ignored and a warning is logged during lot tracking.
3. The number of replicates for the step is determined by the type of flow cell being used in the run.
    - For Standard mode, this is based on the number of lanes in the flow cell (this is stored as part of the Sequencer API configuration).
    - For XP mode, this is always one replicate, since there is already one input tracked for each lane.
4. The automated sequencing step is started.
5. Reagent lots are attached to the step.
    - The Flow Cell and Library Tube reagents in the request are ignored - information from these is tracked in the LIMS as containers and UDFs.
    - Any other reagents in the request are handled as follows:If the reagent is not configured to be tracked, a warning is logged and the reagent is ignored.

- Existing reagent lots are looked up by kit name (determined by Sequencer API configuration), name (the serial number in the request), and lot number (the lot number in the request).
- If one or more matching reagent lot exists in the LIMS, the newest one is used:
  - If the expiry date does not match the expiry in the request, or if the status is not set to Active, the lot is updated to have the correct expiry date and an Active status.
- Otherwise a new lot is created with:
  - Reagent Kit: Matching kit as determined from Sequencer API configuration and step 2 above.
  - Name: Serial number in request
  - Lot Number: Lot number in request
  - Expiry: Expiry date in request
  - Status: Active
- If any reagents were expected to be in the request but were not, these reagents are logged. This prevents the step from being completed without user intervention.

6. Step UDFs/master step fields are updated with the run information parsed from the request. See *Respond to Record InterOps Metrics Call from Sequencer* on page 866, below.
7. Any important events during this request are logged into the Sequencer API log file as well as in the Sequencing Log multiline UDF/field on the step (assuming the step was started successfully). See *Respond to Record InterOps Metrics Call from Sequencer* on page 866, below.

Respond to Record InterOps Metrics Call from Sequencer

1. When the metrics endpoint receives a POST, it:
   - Looks for a matching library tube or flow cell in the LIMS.
   - Find finds the in-progress sequencing step for that container.
2. When the step is found, the run metrics in the request are written to container UDFs/global fields in the LIMS.

Respond to Sequencing Completed Call from Sequencer

If the sequencing run was successful, after the metrics have been recorded, the API call for Sequencing Completed is received. Information is matched by Sequencing Container and the following occurs in the LIMS:

1. The Current Cycle, Current Read, and Status UDFs/master step fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A success message is recorded in the log file, at the info level:

```
Sequencing run with Run ID {runId} of Step '{step.name}' ({step.limsid})
completed successfully.
```

4. The LIMS waits for any automations that are triggered automatically as it advances the step.

5. By default, the LIMS assigns the next steps on the outputs to move them on to the first configured next step - or, if there are no next steps, to complete the protocol.

Respond to Sequencing Errored Call from Sequencer

If the sequencing run was unsuccessful, the API call for Sequencing Error is received. Information is matched by Sequencing Container and the following occurs in the LIMS:

1. The Current Cycle, Current Read, and Status UDFs/master step fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. A failure message is recorded in the log file, at the error level:

```
Step '${Step.name}' (${Step.limsid}) failed with Run ID ${runId}.
```

4. The step is left at the Record Details screen.

Respond to Sequencing RunEndedByUser Call from Sequencer

If the user ends the sequencing run, the API call for Sequencing RunEndedByUser is received. Information is matched by Sequencing Container and the following occurs in the LIMS:

1. The Current Cycle, Current Read, and Status UDFs/master step fields are updated.
2. The multiline Sequencing Log UDF/master step field is updated.
3. The following message is recorded in the log file, at the warning level:

```
"Sequencing run with Run ID ${status.runInfo.runId} of Step
'${step.configuration.name}' (${step.limsid}) aborted by user
${status.runInfo.userName}."
```

4. The step is left at the Record Details screen.

Components Installed with this Integration

The following sections describe the various components - files, properties, reagent categories / label groups, reagent kits, and containers - that are installed by default as part of this integration. Information on installed workflows, protocols, steps, and automation points is provided in the Workflows, protocols, and steps section, above.

Illumina NovaSeq Integration v3.2.1 is distributed as an RPM package - BaseSpaceLIMS-sequencer-api. This RPM package must be installed on the LIMS server.

The BaseSpaceLIMS-sequencer-api RPM installs the following:

- Sequencer API WAR file
- Configuration file - *application.yml*
- Two configuration scripts - *configure_sequencer_api_proxy.sh* and *configure_sequencer_api_application.sh*

The NovaSeq v3 configuration is delivered through the Preconfigured Workflows Package (PCWP) v1.2, which requires installation of the NGS Extensions Package v5.18 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.18 is installed, the latest version is installed by default with the NovaSeq integration. See Release Notes for details.
- If NGS Extensions Package v5.18 or later is already installed, upgrade is not forced or required.

The RPM package installs the components listed in the following table:

Files Installed	Location and Description
Illumina#Sequencer#v2.war	*/opt/gls/clarity/tomcat/current/webapps* War file for NovaSeq v3.2.1 API
configure_sequencer_api_application.sh	*/opt/gls/clarity/config/* Script that configures the Sequencer API application through its external application.yml file
configure_sequencer_api_proxy.sh	*/opt/gls/clarity/config/* Script that configures the proxy to allow communication with the Sequencer API (NovaSeq v3.2.1 API) application
sequencer-api.conf	*/etc/httpd/clarity/* proxy setting to communicate with the LIMS

application.yml Properties

The application.yml file is located at opt/gls/clarity/extensions/sequencing-api/.

- All properties are configured automatically during installation, but you can also configure them by editing the application.yml file and then restarting Tomcat.
- All custom field names, both for recipe and run information, are represented by properties in the file.
- For all custom fields, the names (values in this file) can be changed. However, the property names cannot be changed, removed, or added to. For example, you can change Loading Workflow Type but you cannot change recipe.udfNames.sampleLoadingType.

The properties it contains are listed in the following table:

Property	Description
spring.profiles.active	Tells the application that it is running deployed in Tomcat. Default value: "tomcat" DO NOT CHANGE
clarity.url	Base URL that the Sequencer API service uses to contact the LIMS. The installation script (configure_sequencer_api_application) prompts for this.
clarity.username	Username to be used when communicating with Clarity LIMS

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
clarity.password	Encrypted password to be used when communicating with Clarity LIMS
security.signing-key	Private key that should be used when signing/validating OAuth tokens. Changing this will invalidate any issued tokens.
security.token-expiry	Specifies (in hours) the expiry period for login tokens issued by the Sequencer API. Default value: 88
novaseq.sequenceStepNames	List of NovaSeq sequencing run step names for which the integration may find samples queued. • Names must be an exact match to the name of the step in the LIMS (not the master step/process type). • Each line should be indented to the same point and start with a dash (-). Default value: `- "AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)"`
novaseq.flowcells	List of supported NovaSeq flow cell types. • Type names exactly match the values used by the NVCS run status requests. • To add more types, provide both type and lanes properties, indented to the same point and starting with a dash (-). Default value: `- type: "SP"lanes: 2- type: "S1"lanes: 2- type: "S2"lanes: 2- type: "S4"lanes: 4`
novaseq.reagents	List of supported reagent kits to be tracked on sequencing steps. - lotName: The name of the lot as it appears in the run started request. - kitName: The name of the corresponding reagent kit in LIMS that the lot should be tracked as. • The name may differ in the NVCS request vs. the LIMS configuration. Default value: `- lotName: "Buffer"kitName: "Buffer Cartridge"- lotName: "Cluster"kitName: "Cluster Cartridge"- lotName: "SBS"kitName: "SBS Cartridge"`

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
recipe.udfNames	Configures the names of the UDFs/fields that will be used in the run recipe (see *Run Recipe Contents* on page 864 for more information). • Each value must be enclosed in quotes. Example: recipe.udfNames.runMode "Run Mode" • Value provided for sampleLoadingType must match the value provided in the run configuration. Example: recipe.udfNames.sampleLoadingType "Loading Workflow Type"
recipe.sampleSheet.outputName recipe.sampleSheet.notAvailableValue	Configures the name of the sample sheet file placeholder on the step where run recipe information is populated, and the property value to use when the file is not found.
run.stepUdfNames	Configures the step UDF/master step field names that will be used when recording run results (see *Step UDFs/Custom Fields* on page 860 for more information). • Each value must be enclosed in quotes. Example: run.stepUdfNames.runID "Run ID" • Value provided for sampleLoadingType must match the value provided in the run configuration. • Example: run.stepUdfNames.sampleLoadingType "Loading Workflow Type". It is expected that the run step field and the field on the input derived sample will share the same name.
run.metricUdfNames	Configures the result file UDFs/measurement global fields names that will be used when recording run results. These are the fields that capture the run data (see *Global UDFs/Custom Fields* on page 860 for more information).
run.autoComplete	Determines whether the sequencing run step should be completed automatically after parsing the run metrics on a run (see also run.autoCompleteOnlyAtSuccess). Default value: true See *Configuring autoComplete Properties* on page 874, below.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
run.autoCompleteOnlyAtSuccess	Determines whether the sequencing run step should be: • Autocompleted when the run status is RunCompletedSuccessfully (ifautoCompleteOnlyAtSuccess is true) - or - • Autocompleted regardless of the run status (if autoCompleteOnlyAtSuccess is false). Default value: true See *Configuring autoComplete Properties* on page 874, below.

Reagent Categories/Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- Buffer Cartridge
- Cluster Cartridge
- DPX1
- DPX2
- DPX3
- NaOH
- Resuspension Buffer (RSB)
- SBS Cartridge
- Tris HCl

Container Types

- Library Tube
- SP
- S1
- S2
- S4

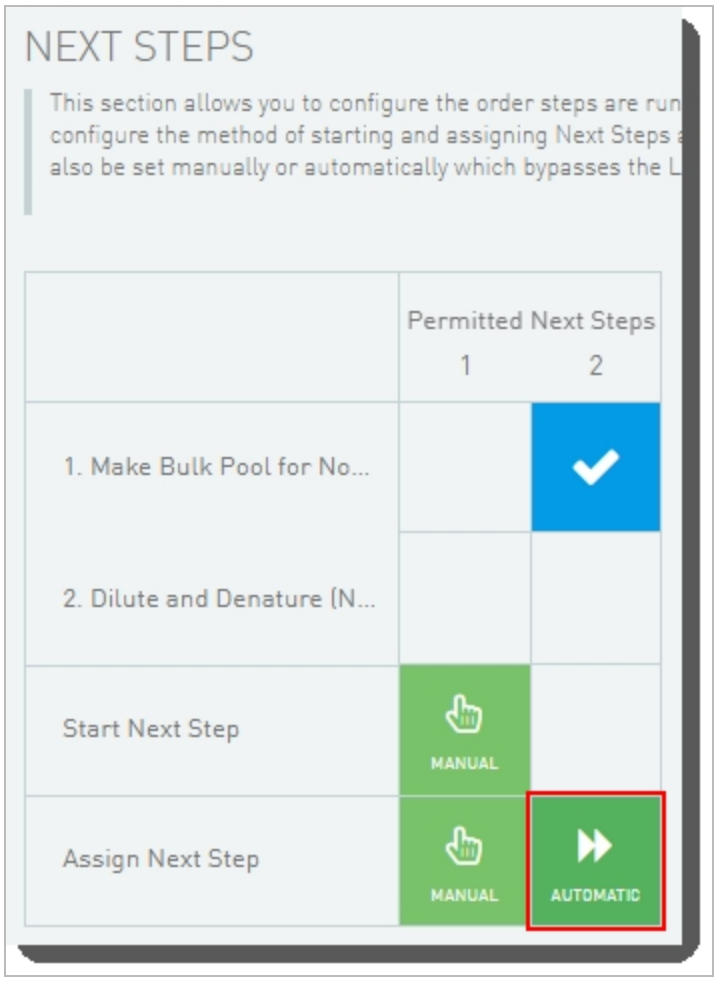
This integration supports:

- Library tube with barcode provided in the format [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}
  Example: AB1234567-XYZ
- SP, S1, S2, or S4 flow cell, with barcode provided in one of the following formats:
  - [A-Za-z0-9]{5}DRXX
  - [A-Za-z0-9]{5}DMXX

- [A-Za-z0-9]{5}DSXX

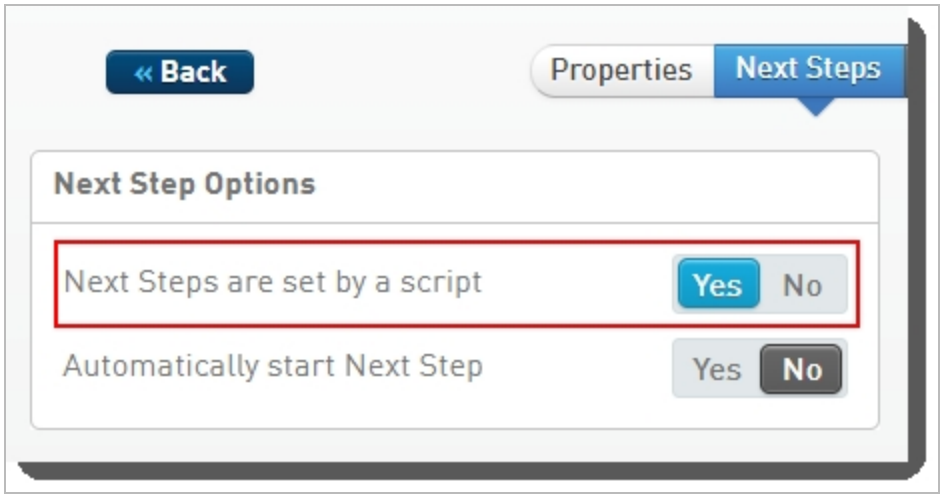
  Example: AB123DRXX

NVCS Configuration



For details on configuring NVCS for integration with BaseSpace Clarity LIMS, contact the Clarity LIMS Support team.

Routing Script Requirements



The requirements for the routing script functionality are as follows:

- On the steps that use the routing script - Define Run Format (NovaSeq 6000 v3.0) and Dilute and Denature (NovaSeq 6000 v3.0) - the Next Step for all samples must be set to Remove from workflow. This value is set by a script, and the user running the step must not change this value in the Assign Next Steps screen.
- LIMS v5.x: In the protocol configuration screen, the following settings are required and must not be changed:
  In the Next Steps section, for the last step in the protocol, the method of assigning the next step must be set to Automatic.

For Research Use Only. Not for use in diagnostic procedures.

- LIMS v4.2.x: In the protocol configuration area, for all protocol steps on which the Routing Script automation is configured, the following setting is required and must not be changed:
  On the Next Steps configuration tab, the Next Steps are set by a script toggle switch must be set to Yes.

For Research Use Only. Not for use in diagnostic procedures.

Configuring autoComplete Properties

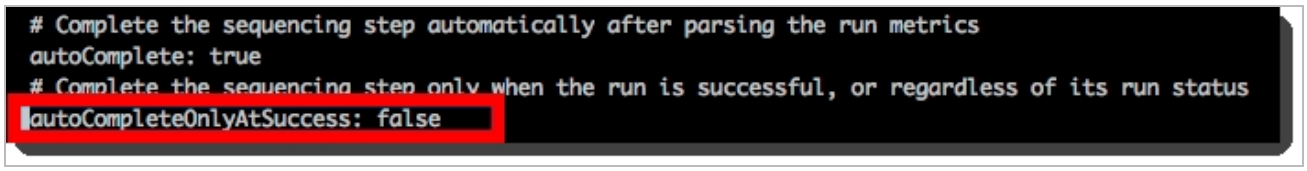
As of NovaSeq Integration v3.2.1, the application.yml configuration file contains two additional properties:

- run.autoComplete
- run.autoCompleteOnlyAtSuccess

These properties determine the conditions under which the last step of the NovaSeq 6000 workflow - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) - is automatically completed:

- Only when the run status is "RunCompletedSuccessfully" (default behavior)
  -or -
- Regardless of the run status

By default, both properties are set to 'true' and the step only completes if the run is successful. If the run fails or is aborted by the user, the user must manually complete the step in the LIMS.



If you would like the step to autocomplete regardless of the result of the sequencing run, you must change the autoCompleteOnlyAtSuccess property value to 'false'.

Enabling/Disabling autoComplete Properties

1. Open the application.yml file located at /opt/gls/clarity/extensions/sequencer-api/application.yml:

```
vi /opt/gls/clarity/extensions/sequencer-api/application.yml
```

2. Edit the value of the autoCompleteOnlyAtSuccessproperty as required.

3. Save the file.

The following table shows how the combined value of the run.autoComplete and run.autoCompleteOnlyAtSuccess properties affects the auto-complete behavior of the sequencing step.

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
true (default)	true (default)	• Step auto-completes only if sequencing run is successful. • If run is not successful, step does not auto-complete and run details are recorded in the LIMS.
true	false	• Step auto-completes, regardless of the run status.

For Research Use Only. Not for use in diagnostic procedures.

run.autoComplete property value	run.autoCompleteOnlyAtSuccess property value	Outcome
false	true	• Step does not auto-complete.
false	false	• Run details are recorded in the LIMS.

Rules and Constraints

- The workflow configuration contains several validation checks. To ensure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks determine:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Reagent labels (indexes) must be unique.
- Only controls are permitted as unindexed samples; all other unindexed samples and pools are not permitted.
- For sample sheet generation constraints, refer to the Bcl2fastq2 Sample Sheet Generation article.
- Users must not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step. This is a fully-automated step and the sequencing service will not update samples correctly if they have been manually started.
- For the automated run to start successfully, the user must have clicked the Validate Run Setup and Generate Sample Sheet button.

Resources

- *NovaSeq 6000 Sequencing System Guide*

NovaSeq 6000 Integration v3.2.1 Validation and Troubleshooting

This guide explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v3.2.1.

The validation process involves:

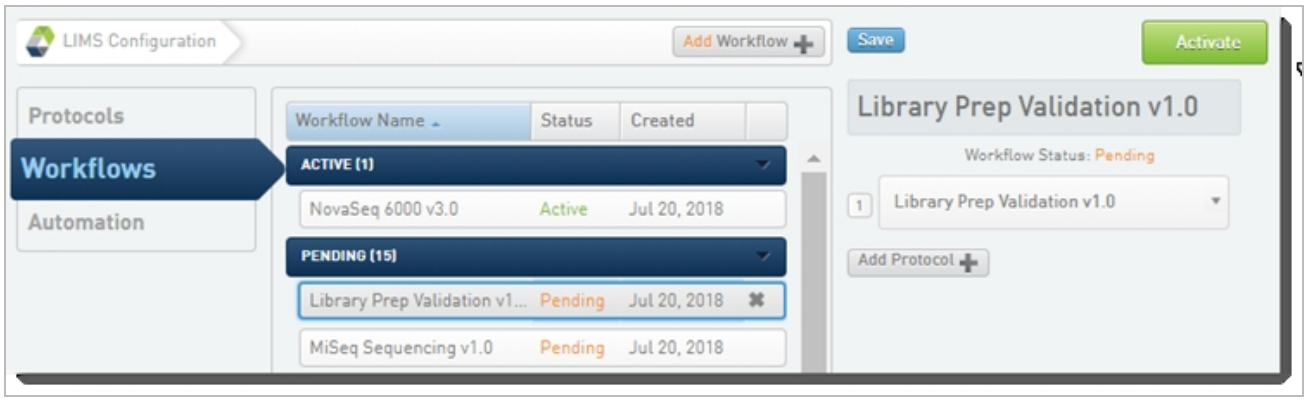
- Running samples through the Library Prep Validation v1.0 workflow.

  - The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries are advanced to the workflow selected by the user.
- Running normalized libraries through the NovaSeq 6000 v3.0 workflow. This validates the following:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v3.0) step to the NovaSeq Standard (NovaSeq 6000 v3.0) or NovaSeq Xp (NovaSeq 6000 v3.0) step.
  - Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software. This file is automatically uploaded to the sequencing instrument via the Sequencer API and is used to set up the run.
  - Automatic validation of run setup information. This information is uploaded to the NovaSeq Control Software (NVCS) via the the Sequencer API and is used to create the run recipe and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics into the LIMS, via the Sequencer API.

Before You Begin

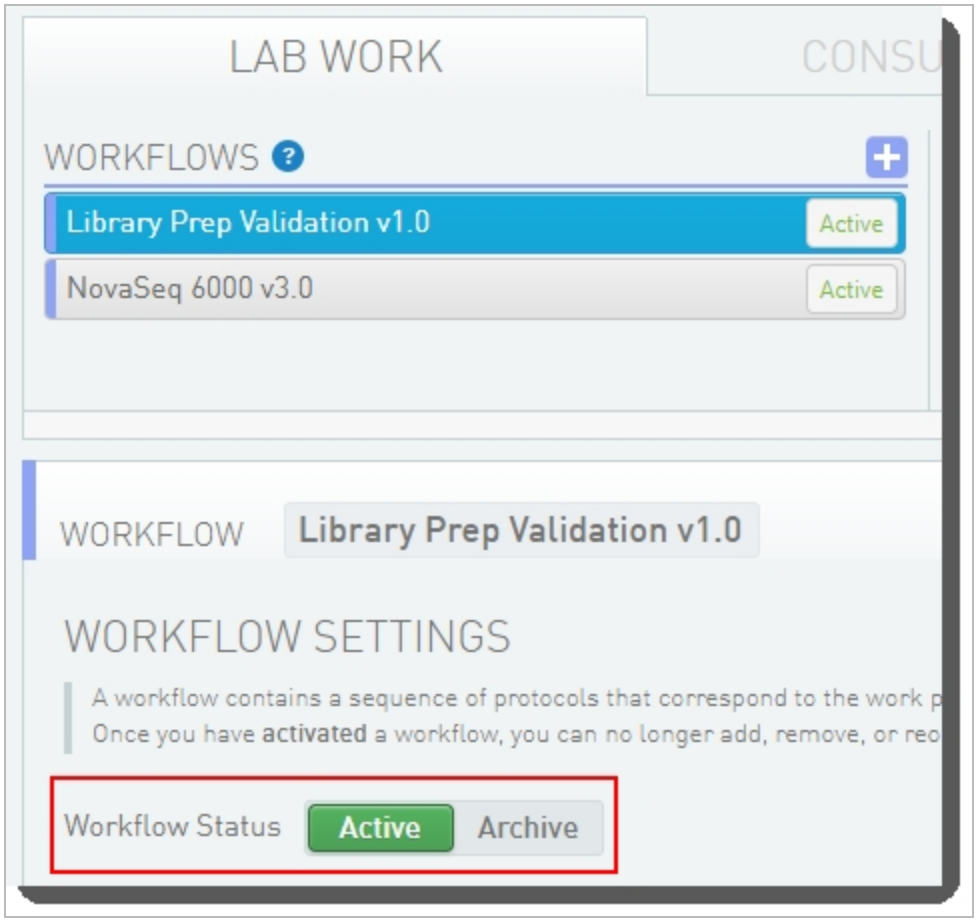
Before you begin to run the validation steps below, note that these steps assume that you have installed the Illumina NovaSeq 6000 Integration Package v3.2.1 and have imported the default LIMS configuration.

Validation Steps



Activate Workflow, Create Project, Add and Assign Samples

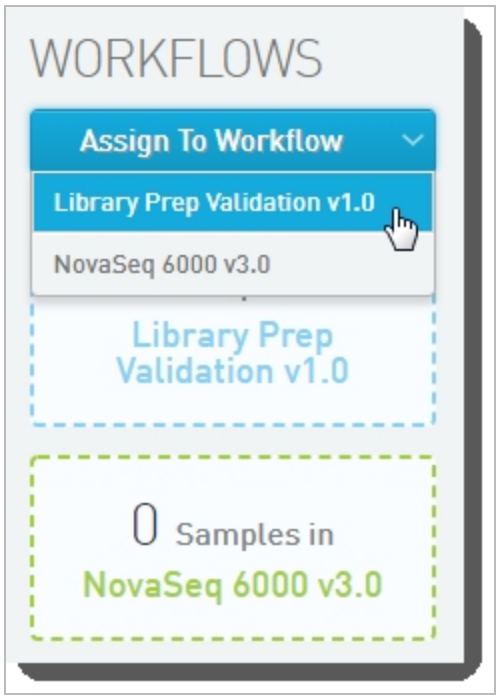
The following steps set up the LIMS in preparation for running samples through the Library Prep Validation v1.0 and NovaSeq 6000 v3.0 workflows.



Step 1: Activate the Workflow

In the LIMS configuration area, activate the Library Prep Validation v1.0 and NovaSeq 6000 v3.0 workflows.

Workflow configuration and activation - LIMS v4.2:

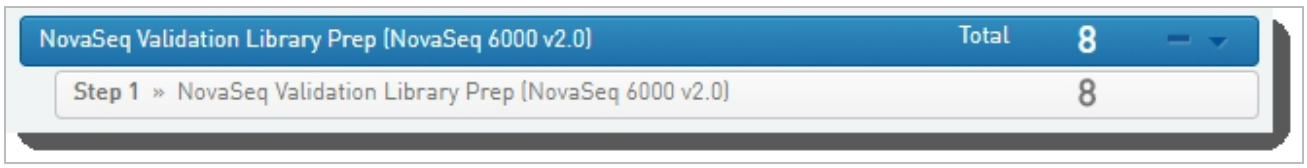


Workflow configuration and activation - LIMS v5:

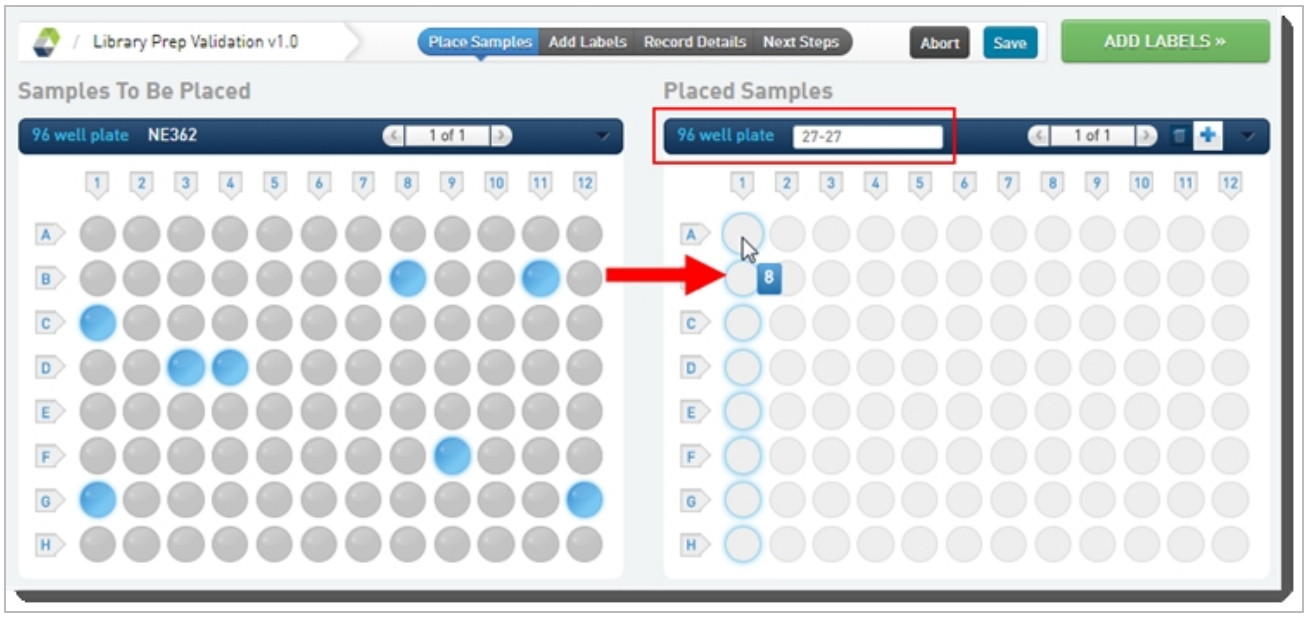
Step 2: Create a Project, Add Samples

1. On the Projects and Samples screen, create a project and add samples to it.
2. Assign your samples to the Library Prep Validation v1.0 workflow.

For Research Use Only. Not for use in diagnostic procedures.



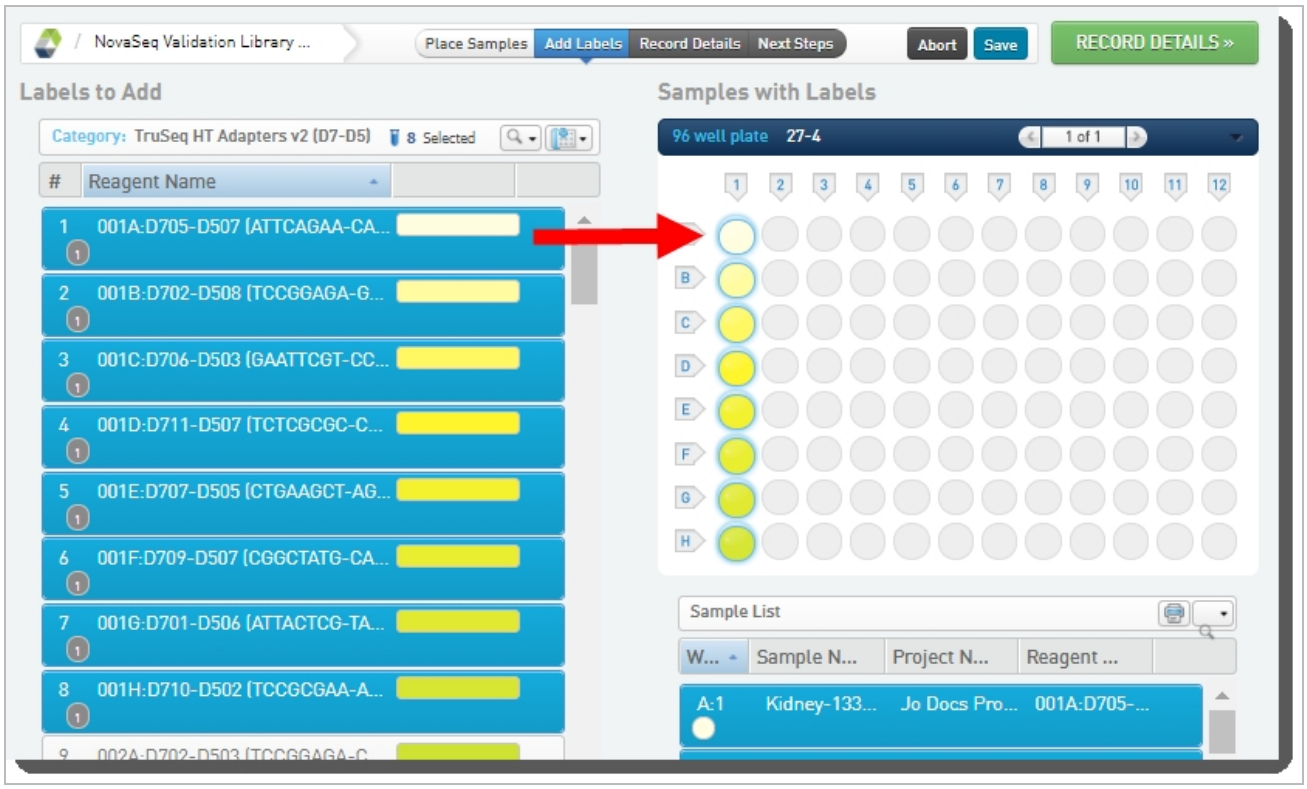
Library Prep Protocol: Library Prep Validation v1.0



This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v3.0 workflow.

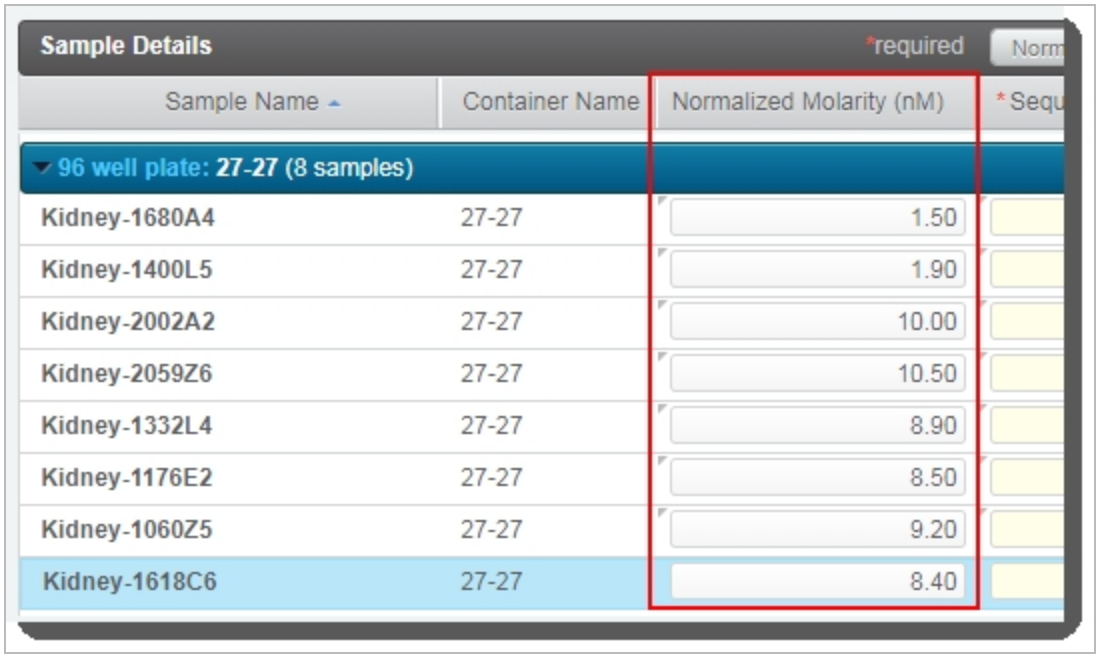
Step 1: Run Library Prep Validation v1.0

1. In Lab View, locate the Library Prep Validation v1.0 protocol. You will see your samples queued for the Library Prep Validation v1.0 step.



2. Add the samples to the Ice Bucket and click View Ice Bucket.
3. On the Ice Bucket screen, click Begin Work.
4. On the Placement screen:
    - In the Placed Samples area on the right, in the container field, scan or enter the barcode of the destination container.
    - Select the samples from the Samples to be Placed area on the left, and then drag them over to the container wells on the right.

- Click Add Labels.

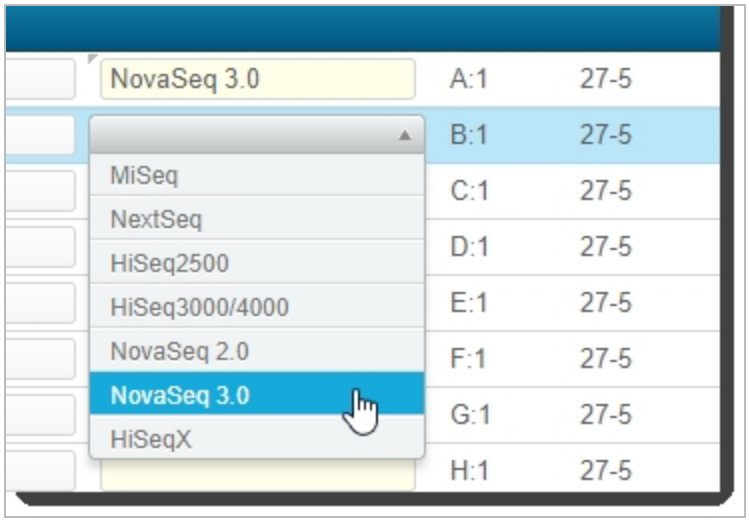


5. On the Add Labels screen, the Labels to Add list is populated with labels from the TruSeq HT Adapters v2 (D7-D5) label group. This is the only label group configured in the out-of-the-box integration and it is used by default in this step.
    - Select labels on the left, and drag them over to the container on the right to assign them to placed samples.

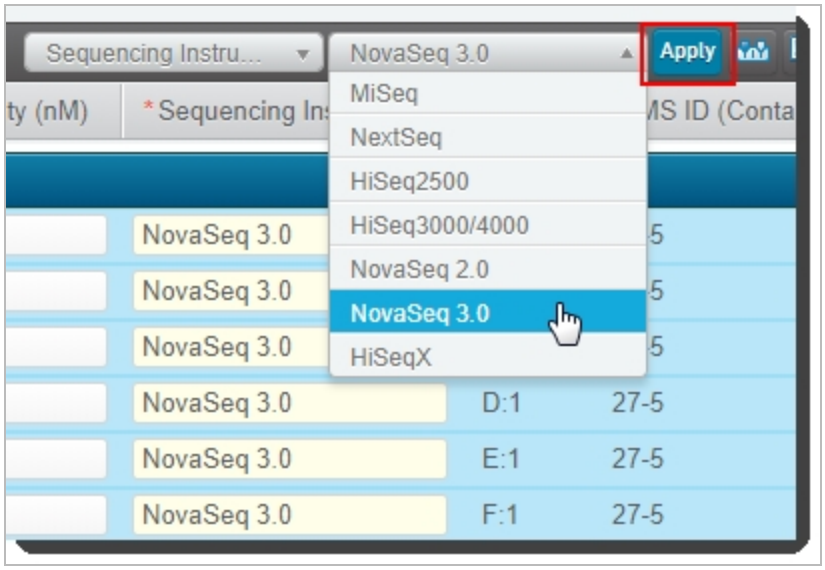
For Research Use Only. Not for use in diagnostic procedures.

- Click Record Details.

6. On the Record Details screen:
   - In the Sample Details table, enter values for Normalized Molarity. You can type values individually, or use Copy/Paste functionality to enter multiple values from a spreadsheet.



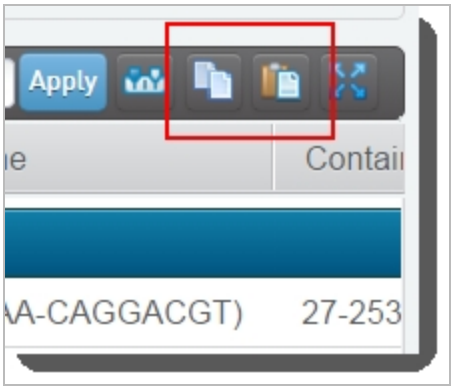
For Research Use Only. Not for use in diagnostic procedures.



- The Sequencing Instrument column indicates the instrument to be used for the sequencing run. Select NovaSeq 3.0.

You can populate the fields in this column using one of the following methods:

- To populate fields individually for each sample: Select from the drop-down list in each row.

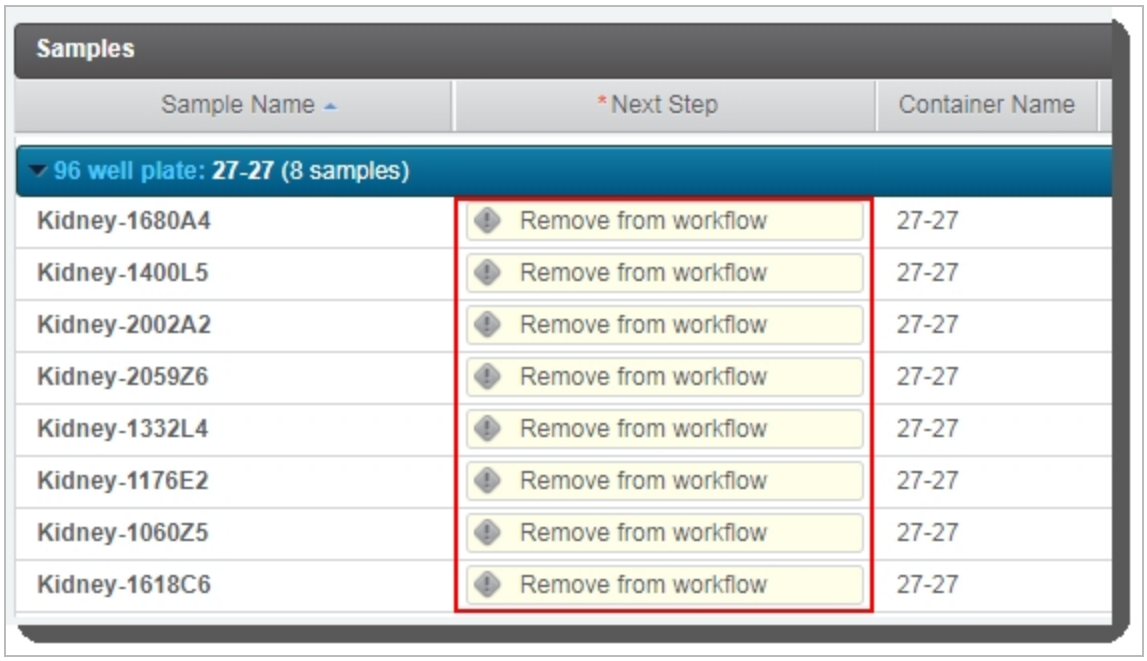


- To populate fields all at once: Use Copy/Paste to enter multiple values from a spreadsheet. Alternatively, click inside the table and press Ctrl + A to select all rows. At the top of the table, select Sequencing Instrument and then select NovaSeq 3.0 from the adjacent drop-down list. Click Apply.

If you are working with a large number of samples, you can use Copy/Paste functionality to enter multiple values from a spreadsheet.

a. Click the Copy Samples button to copy the sample information from the LIMS to the Clipboard.

b. Open a blank Excel document and paste the contents of the Clipboard into the spreadsheet.



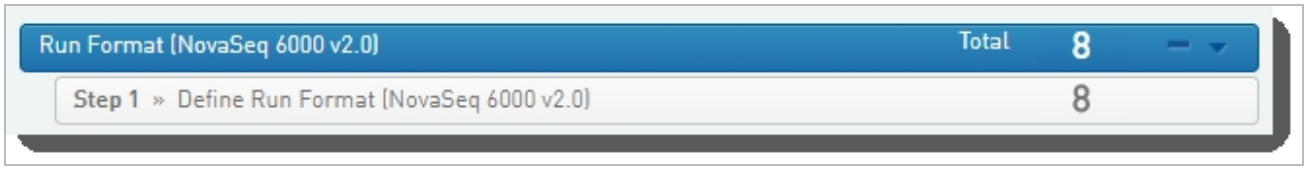
c. In the spreadsheet, enter the Normalized Molarity and Sequencing Instrument values. Select the entire spreadsheet, including the headers (Ctrl + A), and copy (Ctrl + C) the information to the Clipboard.

d. In the LIMS, click the Paste Samples button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window and then click Update to paste into the Sample Details table.

7. Click Next Steps.
   - This triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. Note that the Routing Script automation expects this value and requires it in order to successfully advance samples to the next step.
8. On the Assign Next Steps screen, in the Samples table, the Next Step for all samples is pre-populated with Remove from workflow.

Do not change this value! If Next Step is not set to Remove from workflow, the routing script will not be able to route samples correctly.

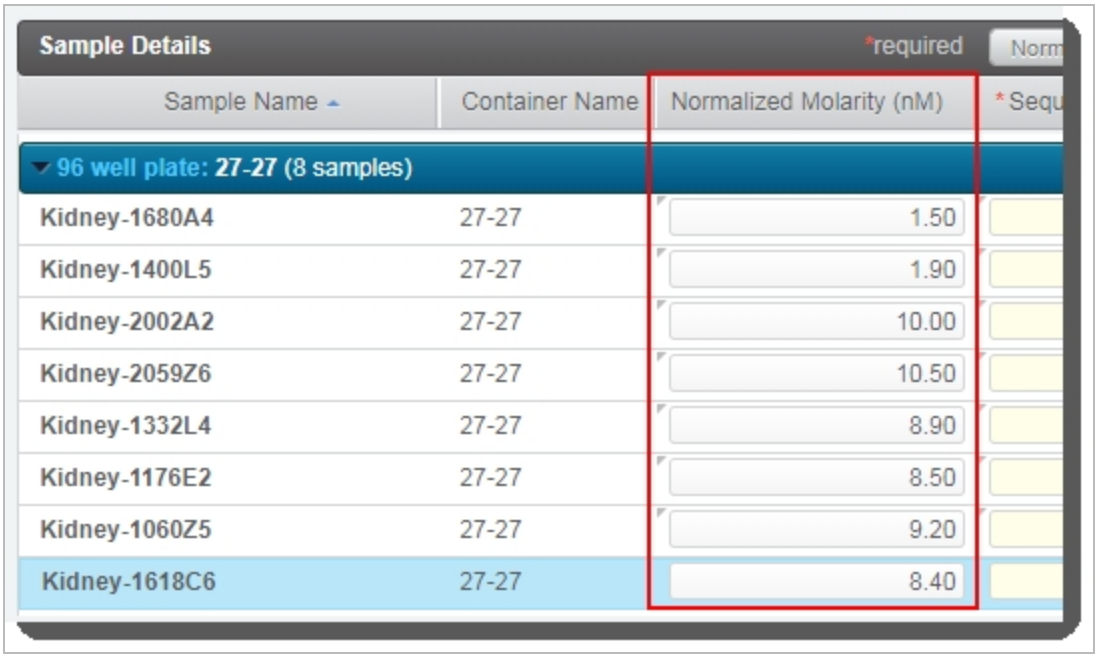
For Research Use Only. Not for use in diagnostic procedures.



9. Click Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v3.0 workflow - Define Run Format (NovaSeq 6000 v3.0). This is the only step in Protocol 1: Run Format (NovaSeq 6000 v3.0).

Protocol 1: Run Format (NovaSeq 6000 v3.0)

This protocol includes a single step - Define Run Format (NovaSeq 6000 v3.0). The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

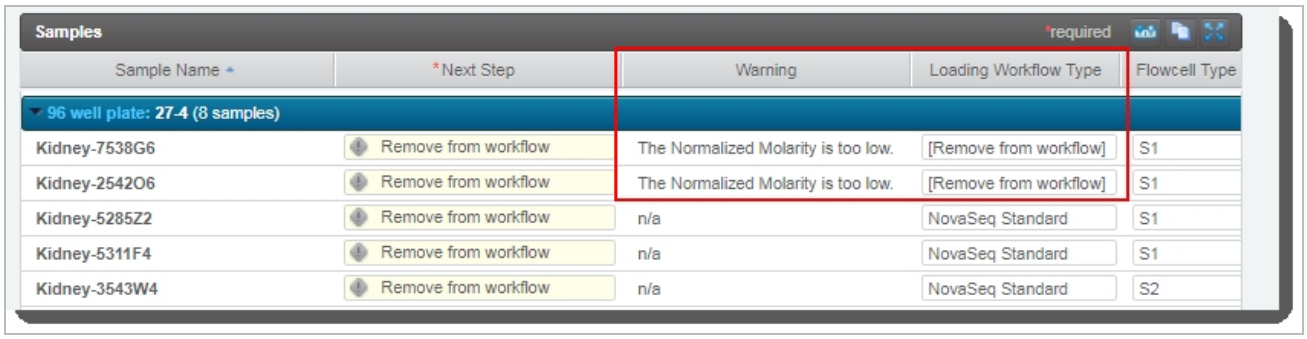


Step 1: Run Define Run Format (NovaSeq 6000 v3.0)

1. In Lab View, locate the Run Format (NovaSeq 6000 v3.0) protocol. You will see your samples queued for the Define Run Format (NovaSeq 6000 v3.0) step.

2. Add the samples to the Ice Bucket and click View Ice Bucket.
3. On the Ice Bucket screen, click Begin Work.
4. On the Record Details screen, in the Sample Details table, populate the following fields (values can vary across samples):
   - Loading Workflow Type - Select NovaSeq Standard or NovaSeq Xp from the drop-down list.

- Flowcell Type - Select SP, S1, S2, or S4.
- Final Loading Concentration (pM) - You may select from the two preset options - 225 (for PCR-free workflows) or 400 (for Nano workflows), or you may enter a different value.



- The Normalized Molarity (nM) values are copied over from the previous step. If you did not populate this column during library prep, you can enter the values here.

5. Click Next Steps. This triggers the Next Steps automation, which:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value, and requires it in order to successfully advance samples to the next step.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (i.e., empty value, not including 0), generates an error message informing the user that the field cannot be empty.
   - Compares each sample's Normalized Molarity value with the Minimum Molarity value.
6. On the Assign Next Steps screen:
   - In the Sample Details table, the Next Step for all samples is pre-populated with Remove from workflow - regardless of the Loading Workflow Type.

Do not change this value! If Next Step is not set to Remove from workflow, the routing script will not be able to route samples correctly.

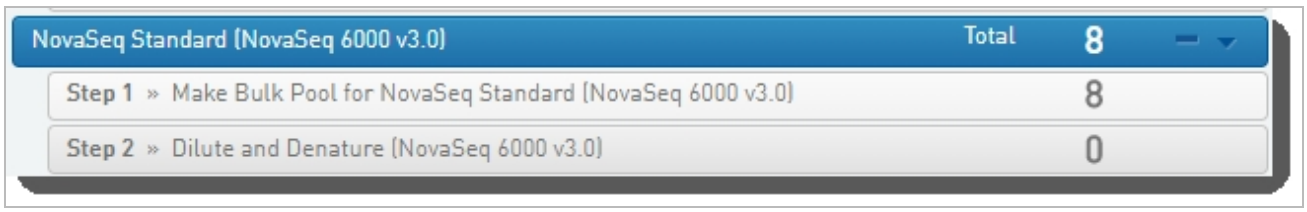
   - For samples whose Normalized Molarity value was found to be lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow and a message is recorded in the Warning field for the sample.

For Research Use Only. Not for use in diagnostic procedures.

At this point you have two options:

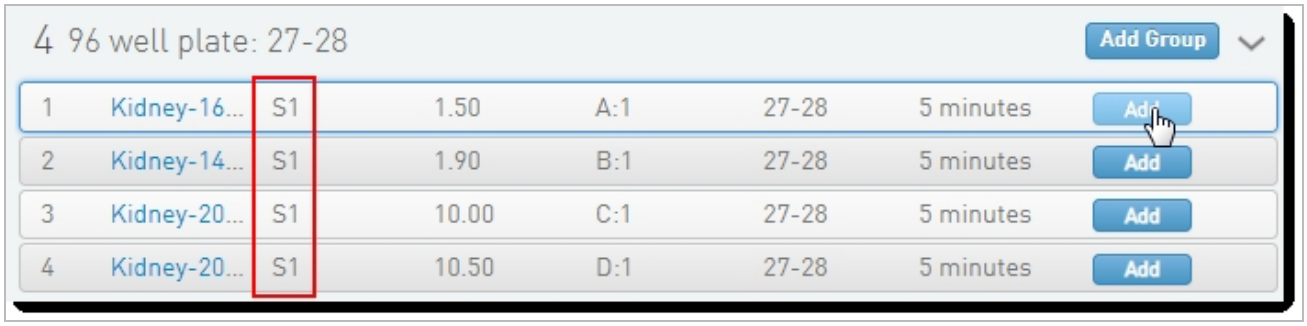
- Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. You will also need to set the Loading Workflow Type to NovaSeq Standard or NovaSeq Xp, as applicable.
- Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question will be removed from the LIMS workflow.

7. Click Finish Step. The Routing Script automation is triggered:
    - Samples whose Loading Workflow Type is set to Remove from workflow (i.e., where Normalized Molarity value is lower than the Minimum Molarity) are removed from the LIMS workflow.
    - Samples whose Loading Workflow Type is NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step. This is the first of two steps in *Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0)* on page 885.
    - Samples whose Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0) step. This is the first of three steps in *Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0)* on page 894.



Protocol 2: NovaSeq Standard (NovaSeq 6000 v3.0)

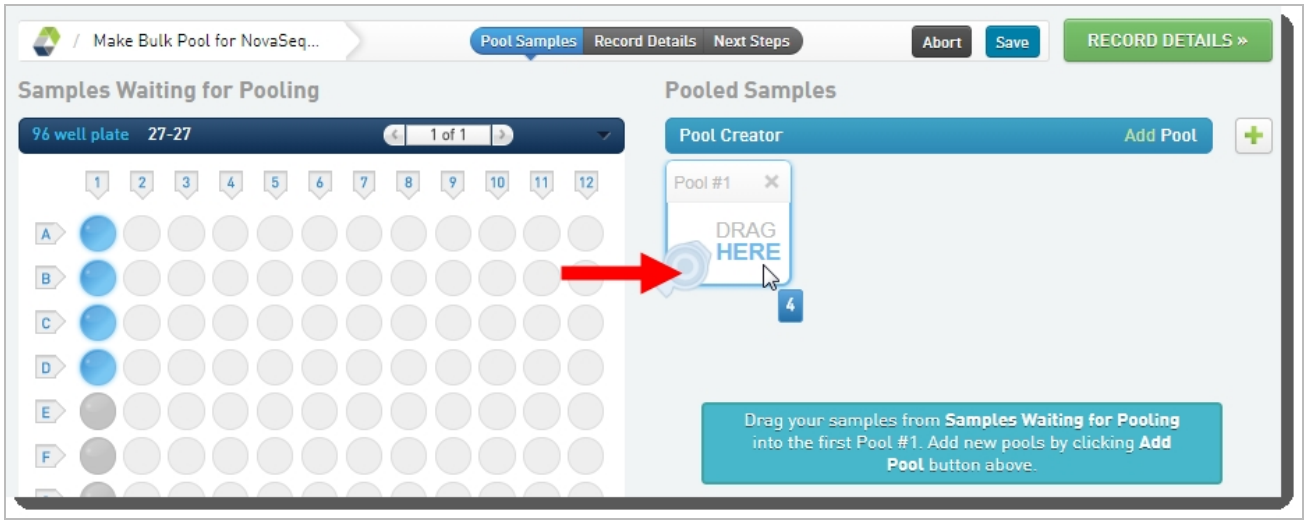
In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run. The protocol contains two steps:



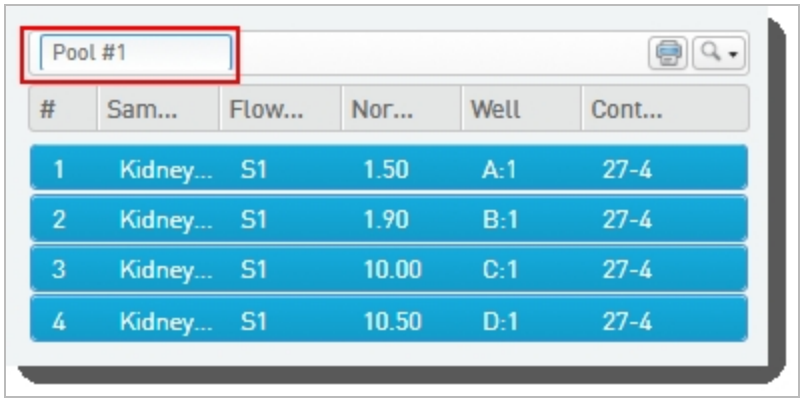
1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)
2. Dilute and Denature (NovaSeq 6000 v3.0)

Step 1: Run Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0) protocol. You will see your samples queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v3.0) step.



2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and click View Ice Bucket.



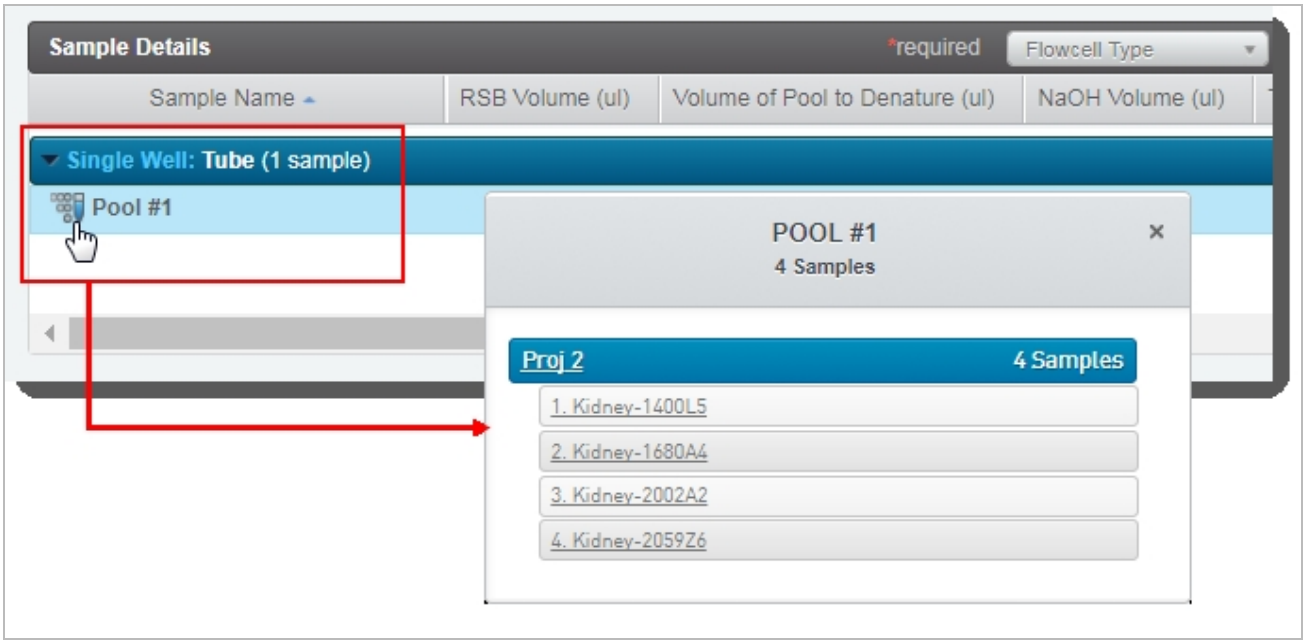
3. On the Ice Bucket screen, click Begin Work.
4. On the Pooling screen:
    - Create a pool by dragging samples into the Pool Creator.

You must only create one pool.

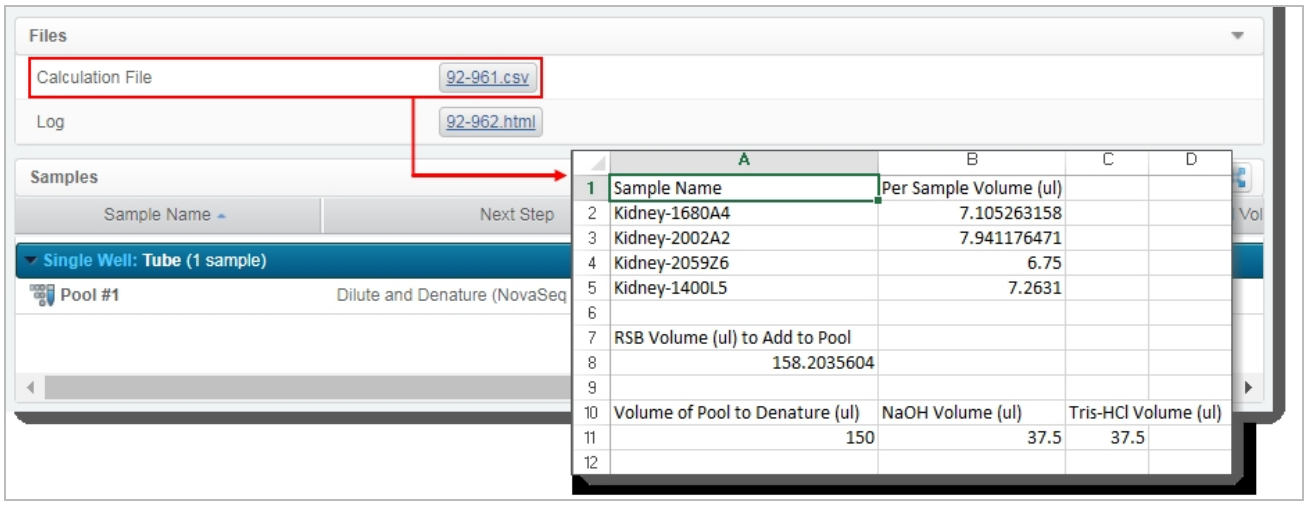
    - You can type a name for the pool, or accept the default name - Pool #1.

- Click Record Details.

5. On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that:
   - All samples in the pool have been assigned the same Flowcell Type.
   - Only one pool has been created.
6. On the Record Details screen, the Step Details area contains two required fields:
   - Number of Flowcells to Sequence - The value entered in this field is used in volume calculations, to ensure that volumes are sufficient for the number of times the pool will be sequenced.
   - Minimum Per Sample Volume (ul) - The value in this field is used to calculate how much of each sample will be included in the pool. The field is pre-populated with the configured default value - 5 ul, but may be edited if required.



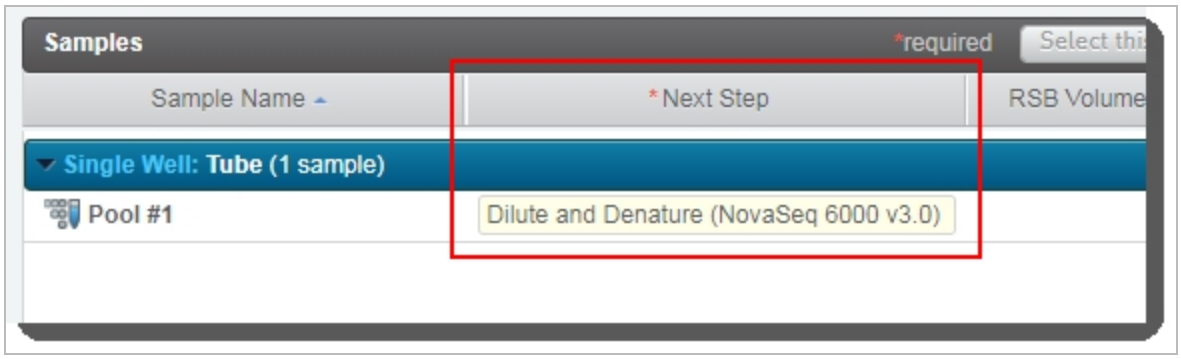
Assuming the default Minimum Per Sample Volume (ul) value of 5, for a given batch:



a. If the smallest Per Sample Volume (ul) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (ul) field.
b. The LIMS then adjusts the Adjusted Per Sample Volume (ul) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- In the Sample Details table, you can click on the pool icon to view details on the pool composition.

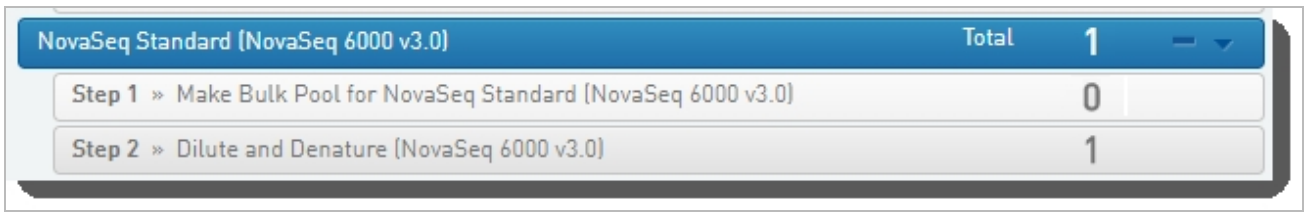
For Research Use Only. Not for use in diagnostic procedures.



- Click Calculate Volumes. This triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
  - Calculates Bulk Pool Volume (ul) value.
  - Sets the value of the Bulk Pool Volume (ul) field, based on the selected Flowcell Type.
  - Calculates the Per Sample Volume (ul) value to be added to the pool.
  - Calculates the Total Sample Volume (ul) value.
  - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (ul) value.
  - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
  - Populates the Volume of Pool to Denature (ul), NaOH Volume (ul) and Tris-HCl Volume (ul) columns of the Sample Details table. Values are set by a script and are not editable by the user.
  - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Click on the file to download it and then open it in Excel.

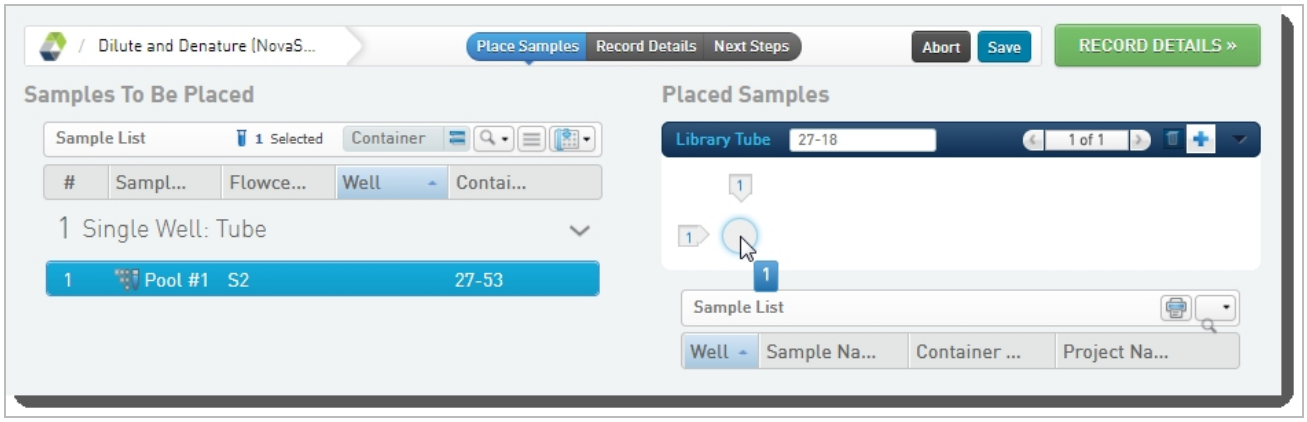
- Click Next Steps. This triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute and Denature (NovaSeq 6000 v3.0).

7. On the Assign Next Steps screen, the next step for samples is already set to the next step in the workflow: Dilute and Denature (NovaSeq 6000 v3.0).



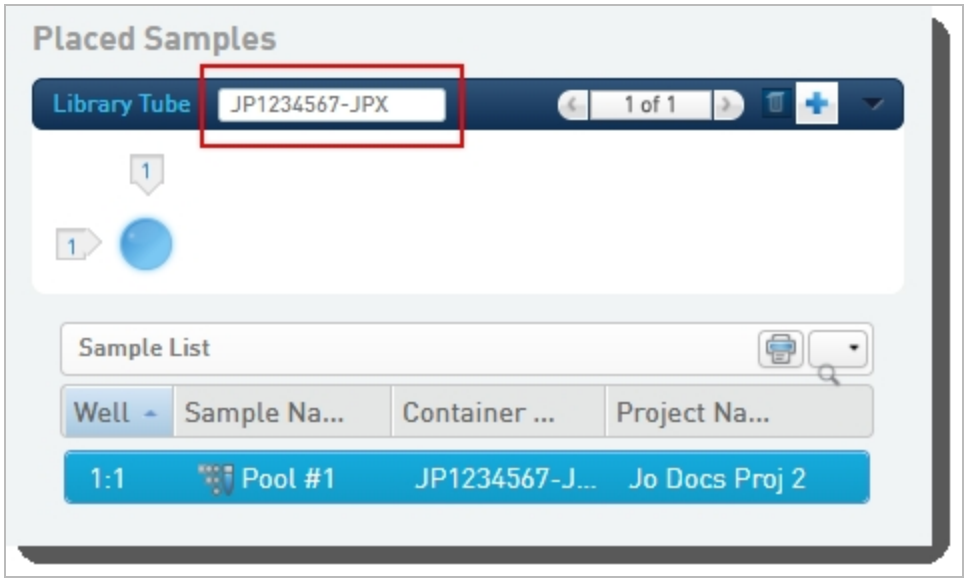
8. Click Finish Step.

At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v3.0) step.



Step 2: Run Dilute and Denature (NovaSeq 6000 v3.0)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0) protocol. You will see the pool of samples queued for the Dilute and Denature (NovaSeq 6000 v3.0) step.



2. Add the samples to the Ice Bucket and click View Ice Bucket.

3. On the Ice Bucket screen, click Begin Work. The Validate Single Input automation is triggered. This automation checks that there is only one container input to the step.
4. On the Placement screen:
    - Drag the pool into the library tube in the Placed Samples area.

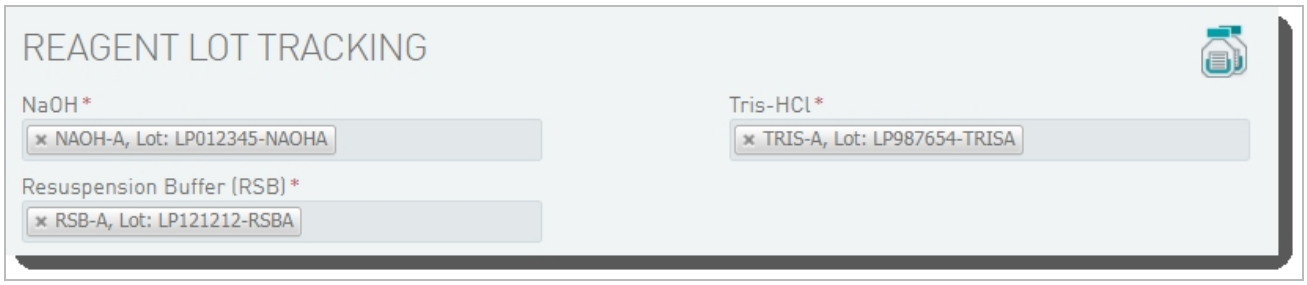
    - Scan or type the barcode of the library tube into the Library Tubefield.

    - Click Record Details.

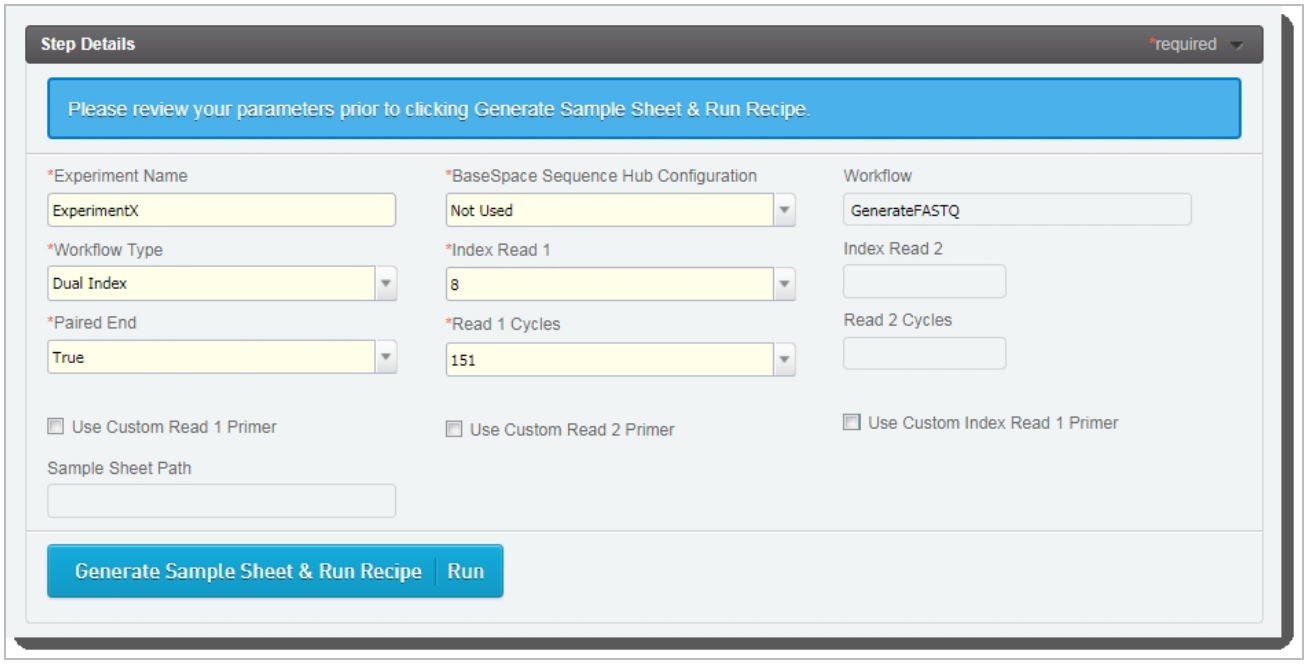
    On exit of the Placement screen, the Validate Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Za-z]{2}[0-9]{7}-[A-Za-z]{3}, and displays an error message if this is not the case. This automation also copies the Flowcell Type and Loading Workflow Type values from step inputs to outputs.
5. On the Record Details screen, the Reagent Lot Tracking section lets you track the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. You will need to add and activate lots for these reagents.

    To add and activate reagent lots:

For Research Use Only. Not for use in diagnostic procedures.



- In a new browser tab, open an additional instance of the LIMS. LIMS v5.0:
  - Navigate to the Consumables configuration screen.
  - LIMS v4.2: Navigate to the Reagents and Controls screen.
- Select the NaOH reagent kit and click New Lot.
- Enter the lot details and click Save.
- Set the Status of Reagent Lot toggle switch to Active.



- Repeat this process to add and activate Resuspension Buffer and Tris-HCl reagent lots.
- Return to your original working browser tab and refresh the page.

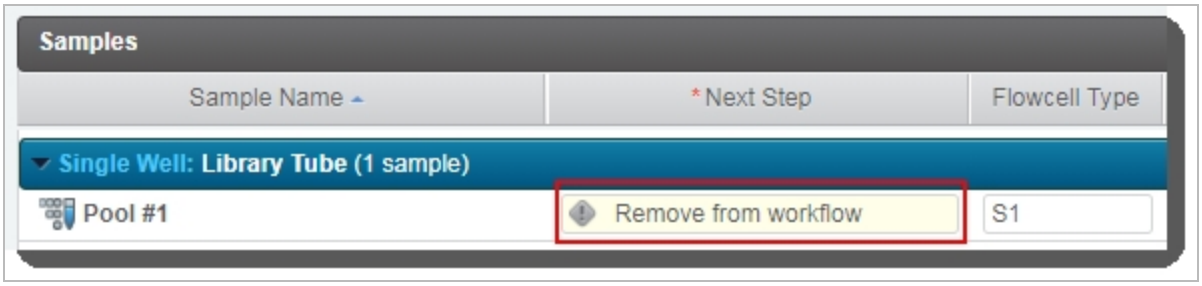
6. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.

For Research Use Only. Not for use in diagnostic procedures.

7. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.

Some of these fields are auto-populated and some must be completed by the user (see the following table for details):

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage
Workflow	Automatically populated with preset - GenerateFASTQ
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.



Field	Value
Paired End	Select from preset options: True or False
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237 documentation.
Use Custom Read 2 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237 documentation.
Use Custom Index Read 1 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237 documentation.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.

8. On the Record Details screen, click Validate Run Setup and Generate Sample Sheet . This triggers the automation script, which:
    - Validates the parameters entered on the Record Details screen.
    - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Detailsscreen.

- Click Next Steps.

9. On the Assign Next Steps screen, the Next Step for samples is pre-populated with Remove from workflow. The Routing Script automation expects this value, and requires it in order to successfully advance samples to the next step.

Do not change this value. If Next Step is not set to Remove from workflow, the routing script will not be able to route samples correctly.

10. Click Finish Step.
    On exit from the step:
    - The Routing Script automation is triggered and samples are routed to Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0).
    - In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.

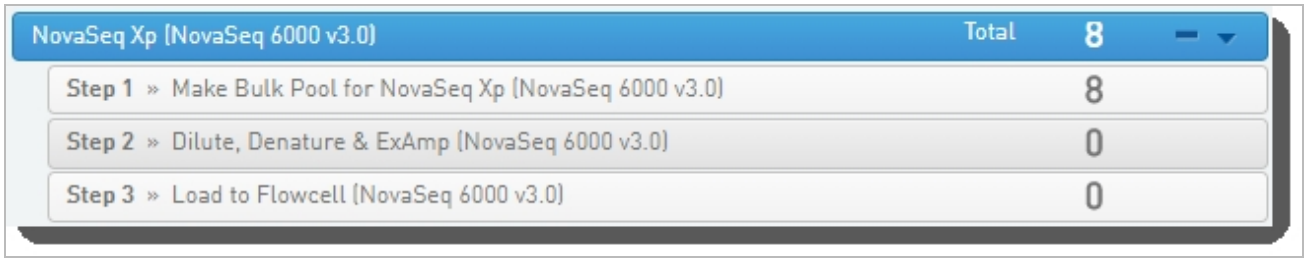
At this point in the workflow, the user interaction ends. Proceed to *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)* on page 908

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step. The integration will do this automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v3.0)

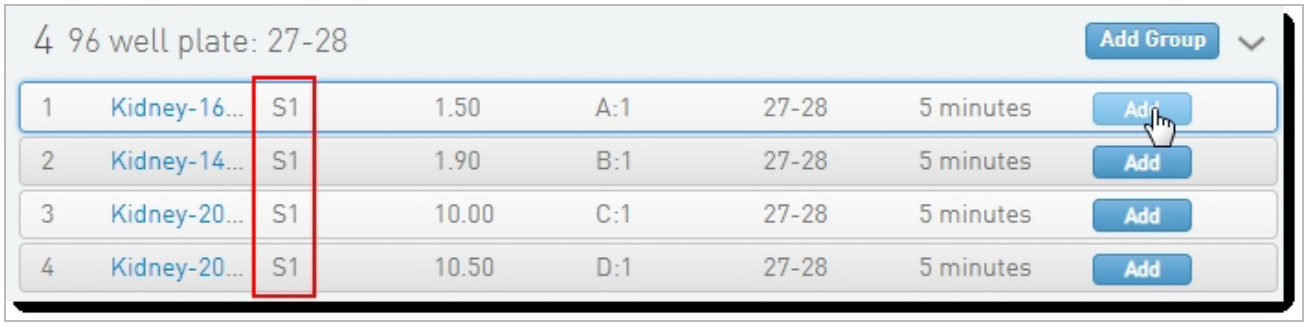
In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v3.0) step.

The protocol contains three steps:



1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)

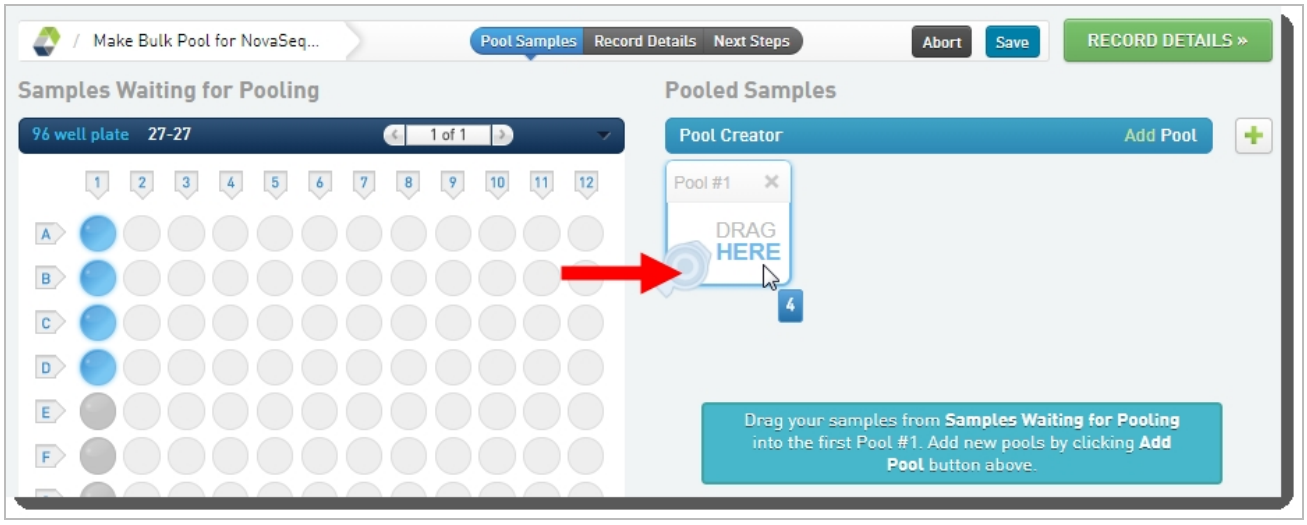
For Research Use Only. Not for use in diagnostic procedures.



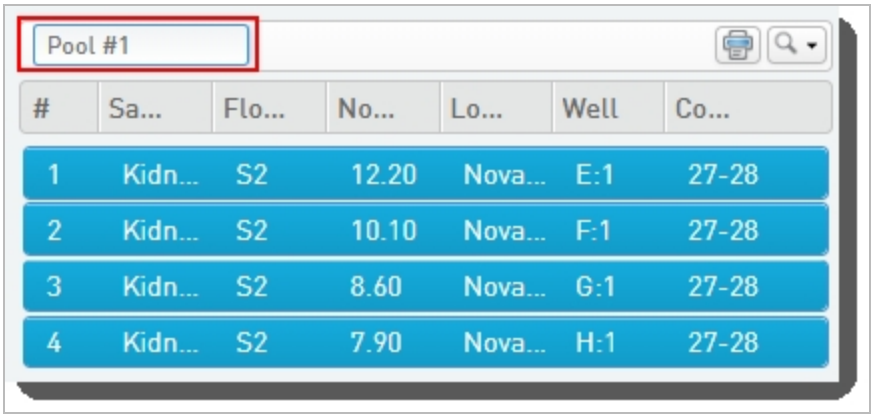
2. Dilute, Denature and ExAmp (NovaSeq 6000 v3.0)
3. Load to Flowcell (NovaSeq 6000 v3.0)

Step 1: Run Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v3.0)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v3.0) protocol. You will see your samples queued for the Make Bulk Pool for NovaSeq XP (NovaSeq 6000 v3.0) step.



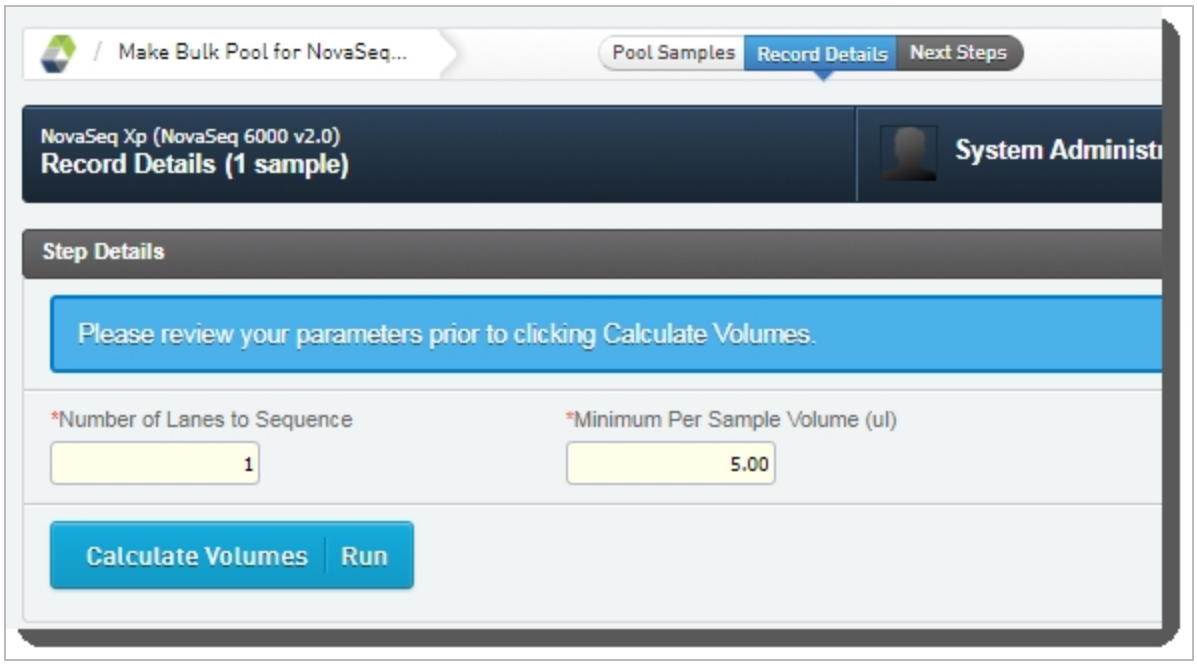
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and click View Ice Bucket.



3. On the Ice Bucket screen, click Begin Work.
4. On the Pooling screen:
    - Create a pool by dragging samples into the Pool Creator.

    You must only create one pool.

For Research Use Only. Not for use in diagnostic procedures.

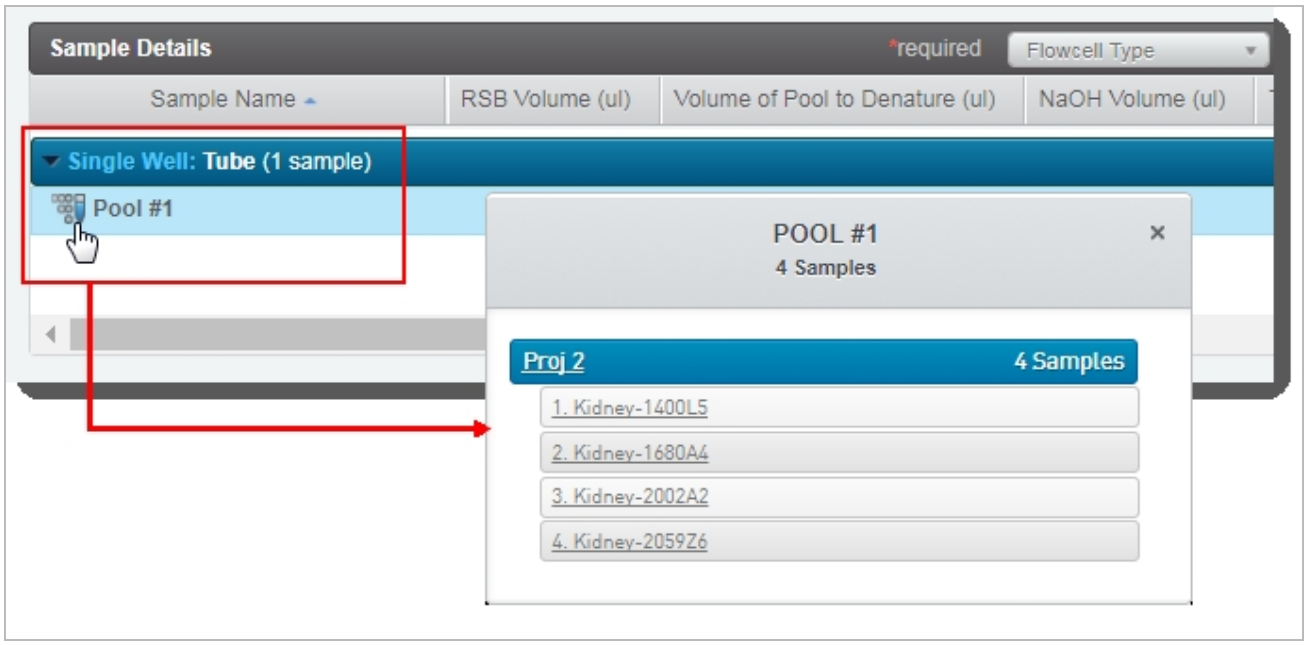


- You can type a name for the pool, or accept the default name - Pool #1.

- Click Record Details.

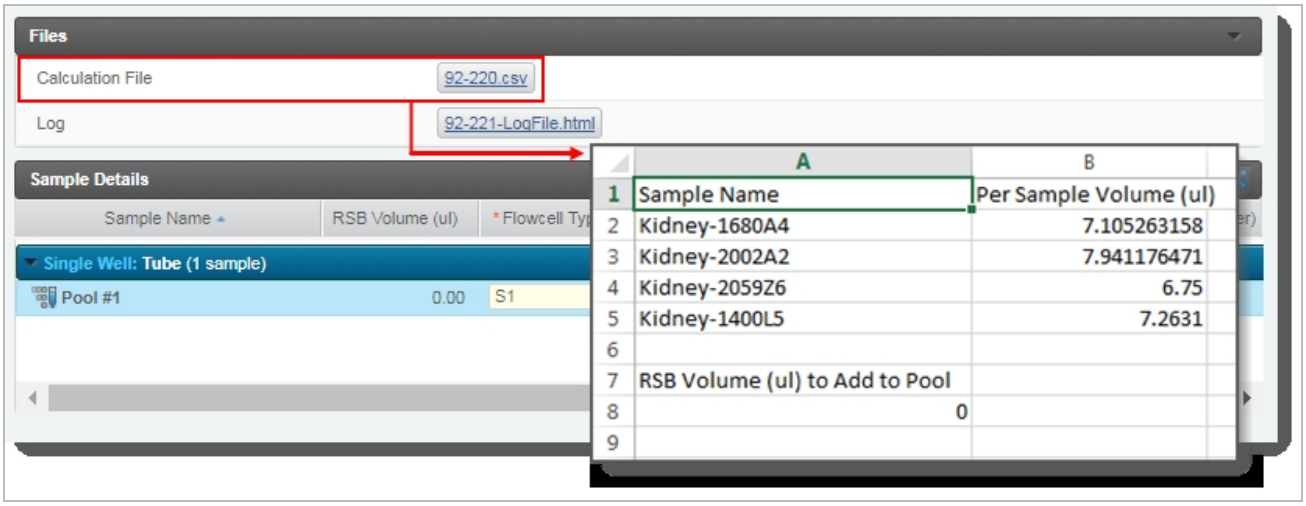
5. On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that:
    - All samples in the pool have been assigned the same Flowcell Type.
    - Only one pool has been created
6. On the Record Details screen, the Step Details area contains two required fields:
    - Number of Lanes to Sequence - The value entered in this field is used in volume calculations, to ensure that volumes are sufficient for the number of times the pool will be sequenced.
    - Minimum Per Sample Volume (ul) - The value in this field is used to calculate how much of each sample will be included in the pool. The field is pre-populated with the configured default value - 5 ul, but may be edited if required.

For Research Use Only. Not for use in diagnostic procedures.



Assuming the default Minimum Per Sample Volume (ul) value of 5, for a given batch:

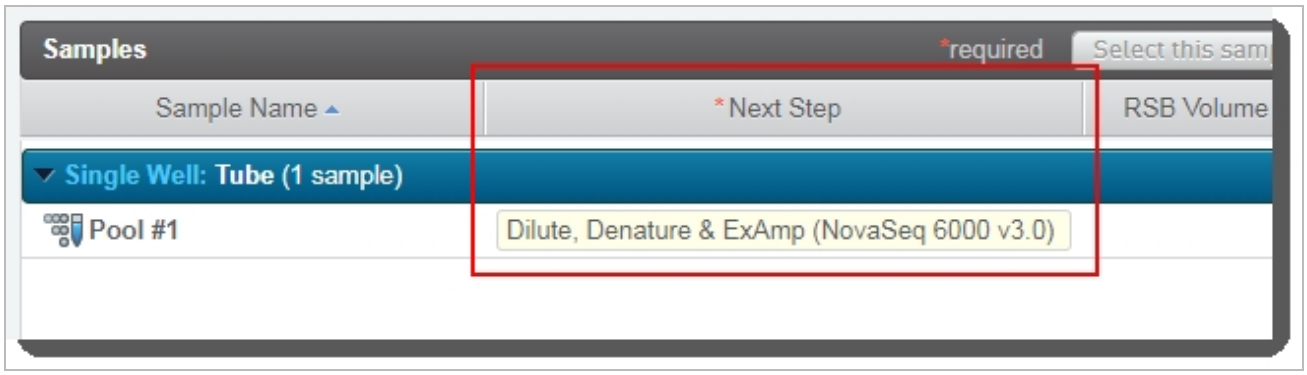
a. If the smallest Per Sample Volume (ul) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (ul) field.



b. The LIMS then adjusts the Adjusted Per Sample Volume (ul) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- In the Sample Details table, you can click on the pool icon to view details on the pool composition.

For Research Use Only. Not for use in diagnostic procedures.

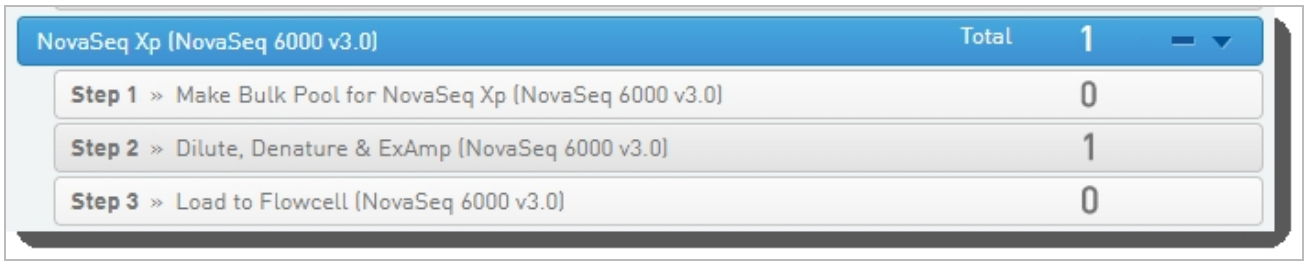


- Click Calculate Volumes. This triggers the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
  - Calculates Bulk Pool Volume (ul) value.
  - Calculates the Per Sample Volume (ul) value to be added to the pool.
  - Calculates the Total Sample Volume (ul) value.
  - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (ul) value.
  - The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
  - The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Click on the file to download it and then open it in Excel.

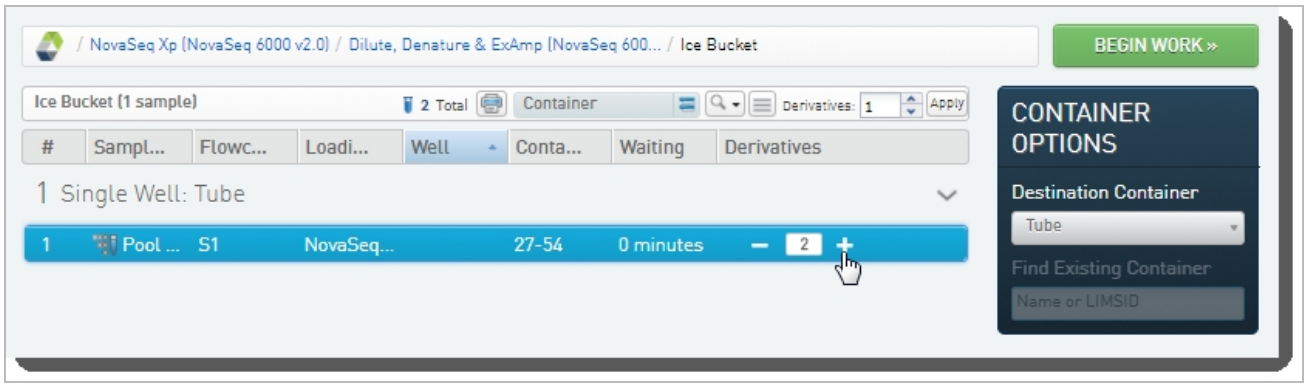
- Click Next Steps. This triggers the Set Next Step automation, which:
  - Copies the Flowcell Type values from the step inputs to the step outputs.
  - Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol - Dilute, Denature and ExAmp (NovaSeq 6000 v3.0).

7. On the Assign Next Steps screen, the next step for samples is already set to the next step in the workflow - Dilute, Denature and ExAmp (NovaSeq 6000 v3.0).

For Research Use Only. Not for use in diagnostic procedures.



8. Click Finish Step.



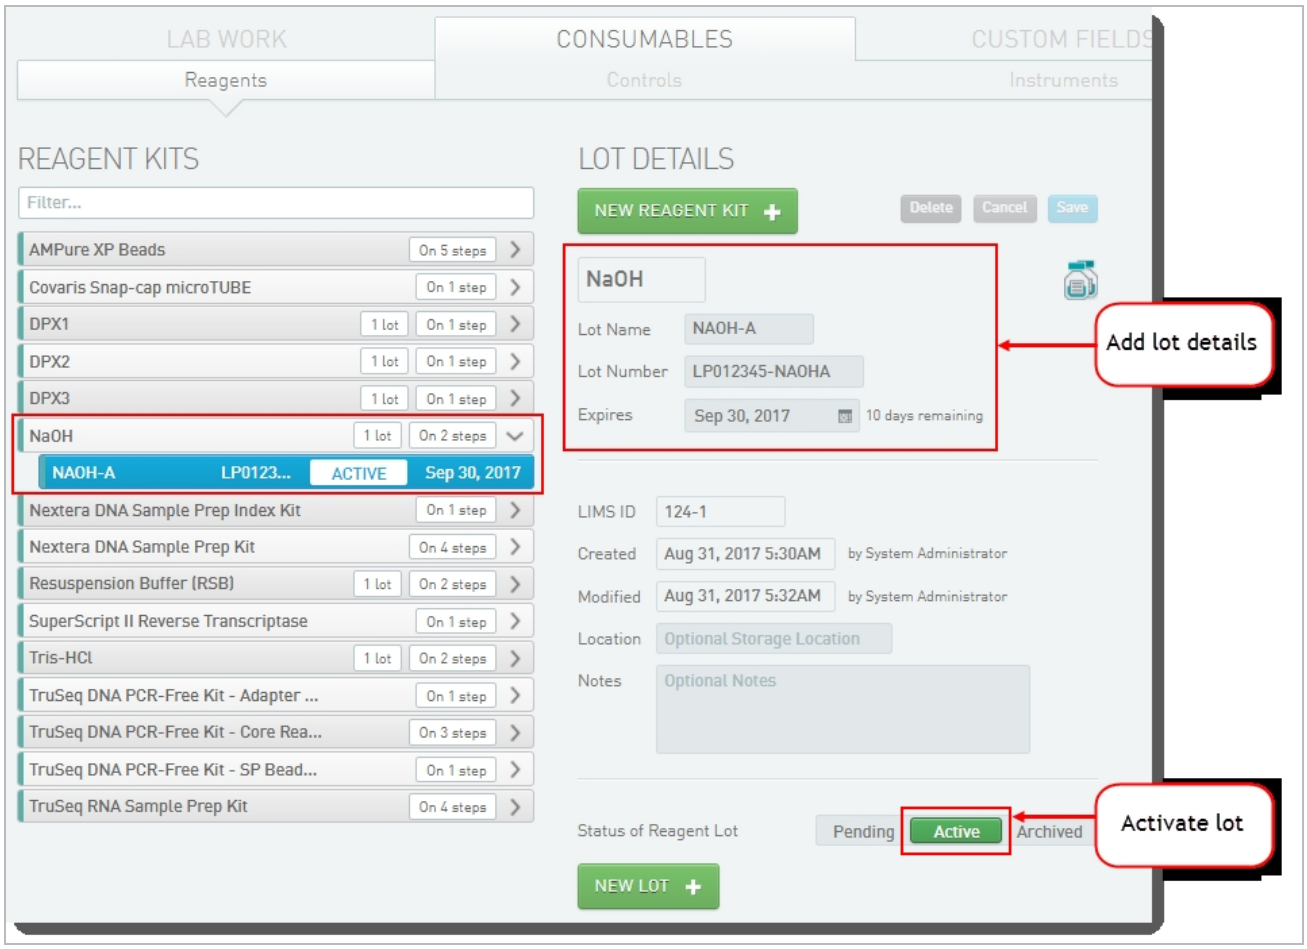
At the end of this step, the pool of samples automatically advances to the Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) step.

Step 2: Run Dilute, Denature and ExAmp (NovaSeq 6000 v3.0)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v3.0) protocol. You will see the pool of samples queued for the Dilute, Denature and ExAmp (NovaSeq 6000 v3.0) step.

2. Add the pool to the Ice Bucket and click View Ice Bucket.
3. [Optional] On the Ice Bucket screen, set the number of derivatives to create (these will be placed into the flow cell lanes) and click Begin Work.

4. On entry to the Record Details screen, the Calculate Volumes automation is triggered. This automation sets the following values based on the selected Flowcell Type:
    - BP Aliquot Volume (ul)
    - NaOH Volume (ul)



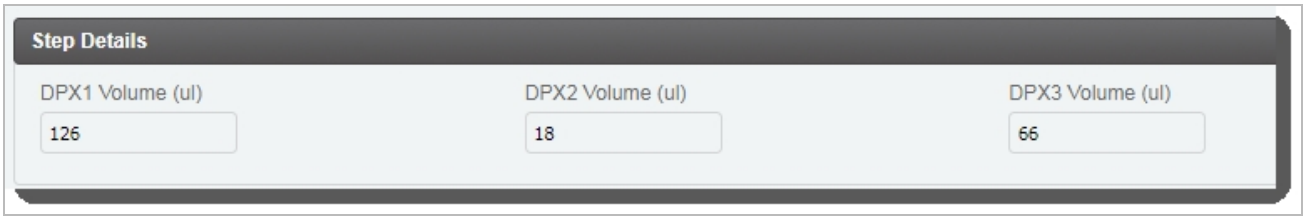
- Tris-HCl Volume (ul)
- DPX1 Volume (ul)
- DPX2 Volume (ul)
- DPX3 Volume (ul)
- Mastermix per Lane (ul)
- The automation also populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- The automation also generates the Calculation File (CSV) and attaches it to the step. This file contains information about the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool (see the next step).

5. On the Record Details screen, the Reagent Lot Tracking section lets you track the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. You will need to add and activate lots for these reagents

   To add and activate reagent lots:

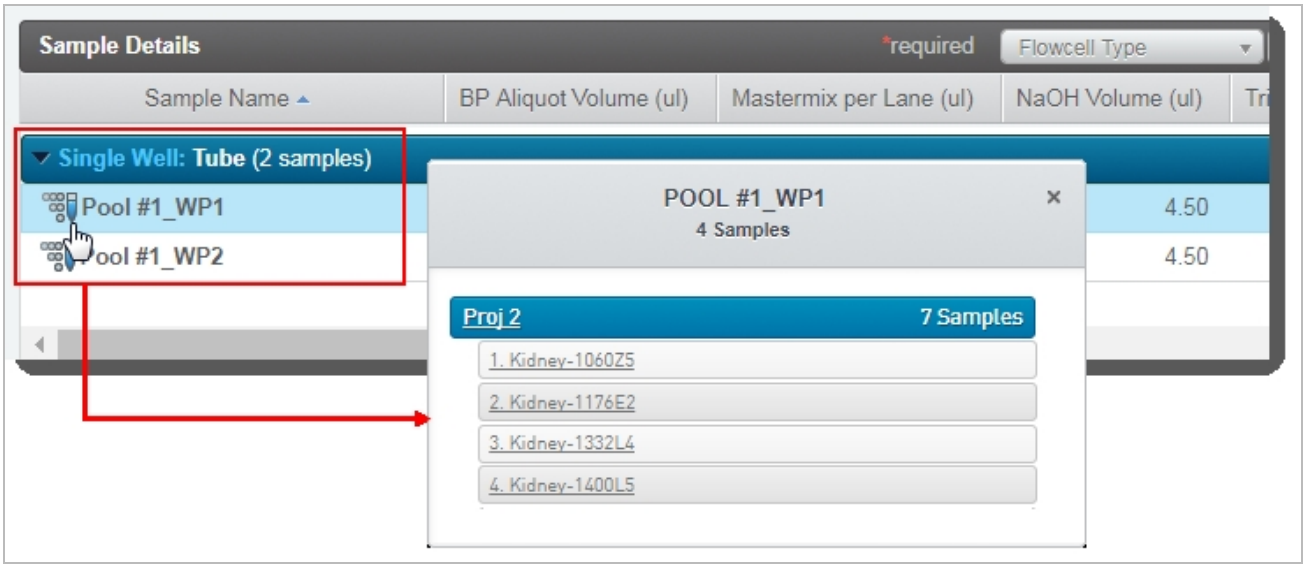
   - In a new browser tab, open an additional instance of the LIMS. LIMS v5.0:
   – Navigate to the Consumables configuration screen.LIMS v4.2:
   – Navigate to the Reagents and Controls screen.
   - Select one of the reagent kits listed above (NaOH shown below) and click New Lot.
   - Enter the lot details and click Save.
   - Set the Status of Reagent Lot toggle switch to Active.

For Research Use Only. Not for use in diagnostic procedures.

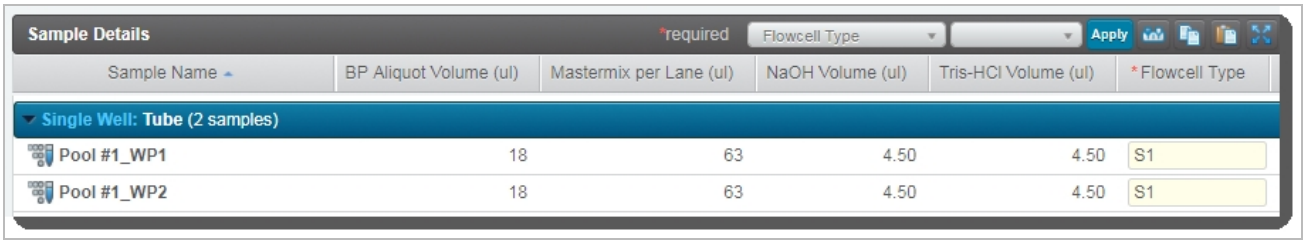


- Repeat this process to add and activate the remaining reagent lots.
- Return to your original working browser tab and refresh the page.

6. On the Record Details screen:
   - In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.

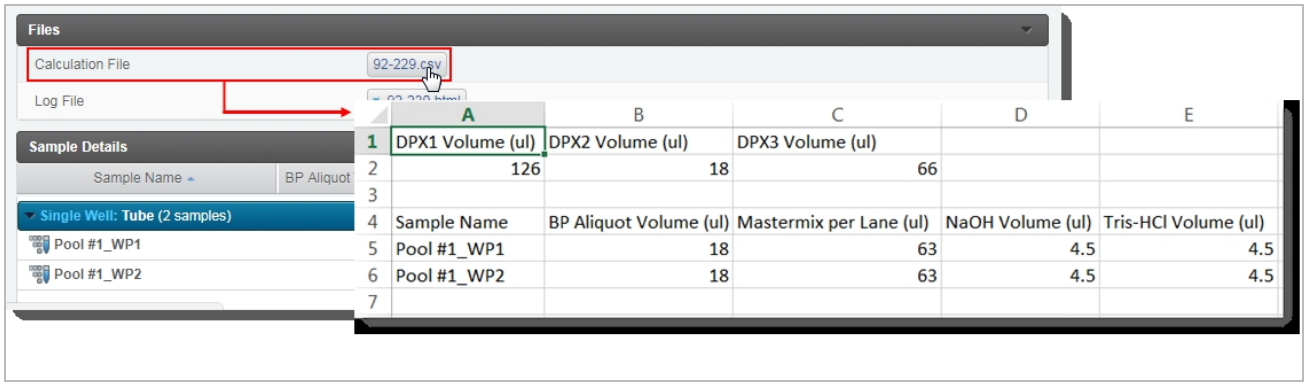


For Research Use Only. Not for use in diagnostic procedures.

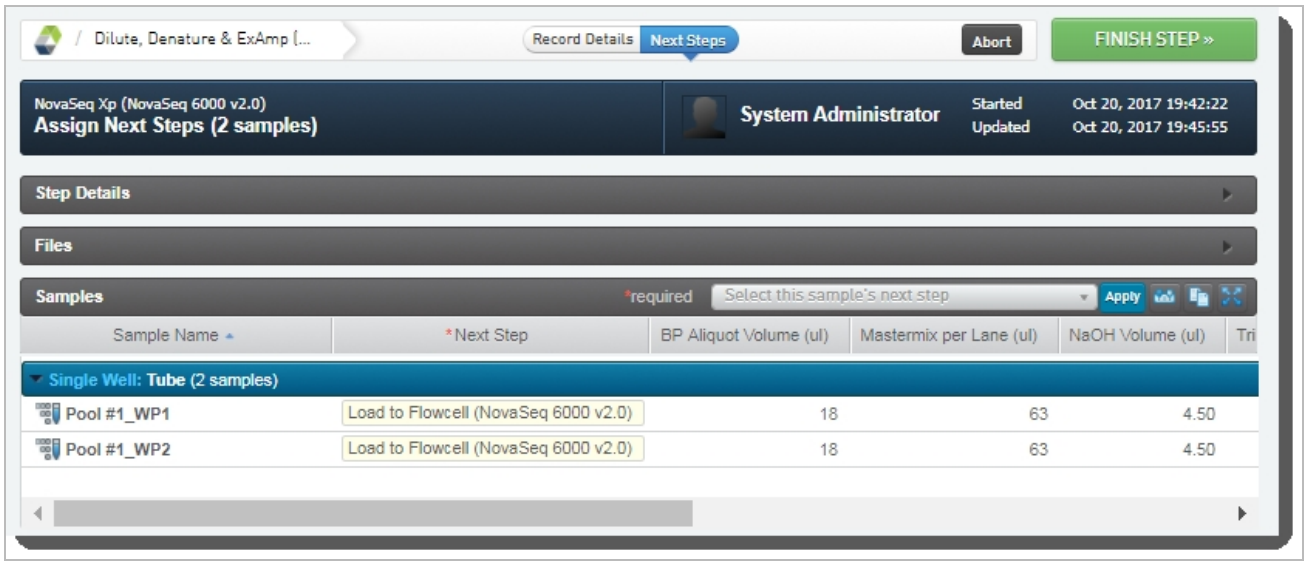


- In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. These values are set by a script and are not editable by the user running the step.

- In the Sample Details table, you can click on the pool icon to view details on the working pool composition.



- The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are already populated. These values are set by a script and are not editable by the user running the step.
- The Flowcell Type and Loading Workflow Type columns are already populated.
- The working pool number is appended to the bulk pool name. This allows you to quickly identify which working pools are derived from the same bulk pool.



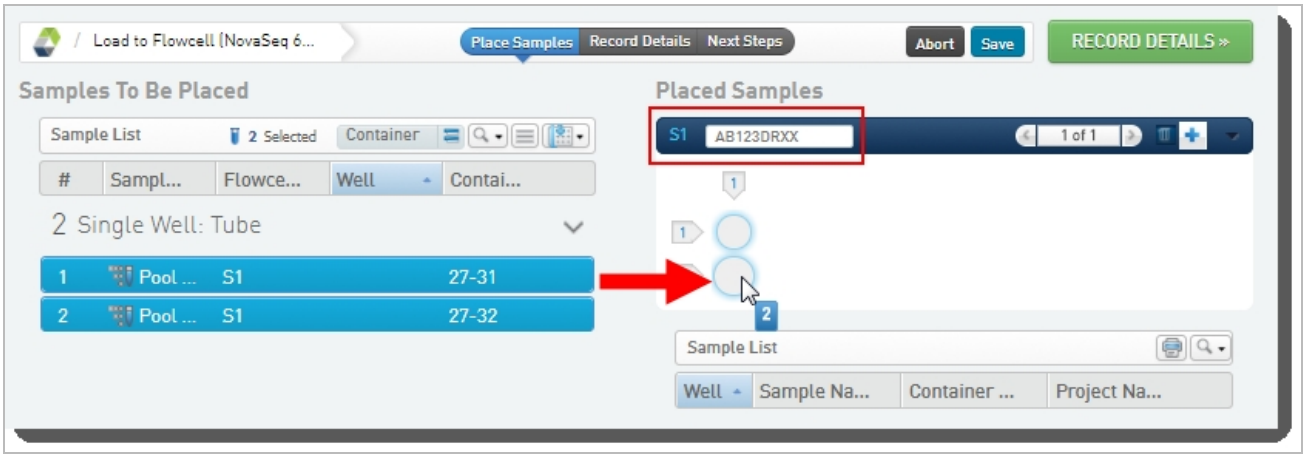
For Research Use Only. Not for use in diagnostic procedures.

7. In the Files area, click on the Calculation File (CSV) to open it and view details on the DPX Mastermix volume, and the volume of Mastermix, NaOH. and Tris-HCl to add per working pool.

8. Click Next Steps.
9. On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v3.0).

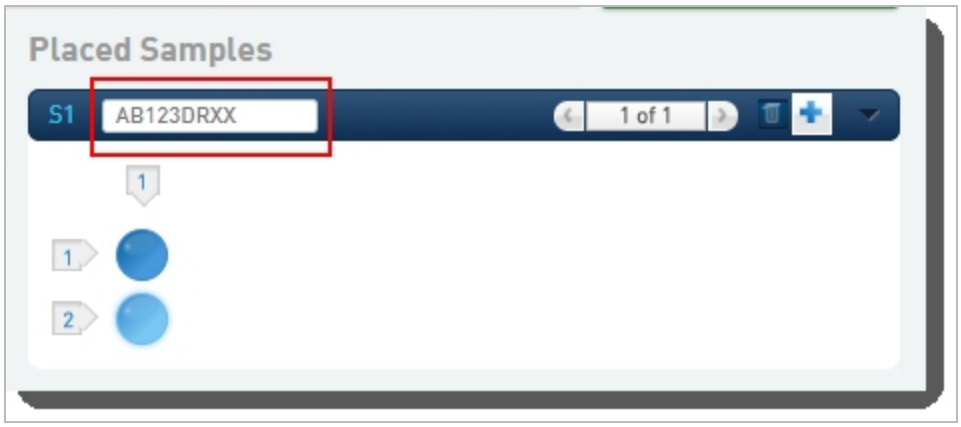
10. Click Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v3.0)



1. On the Ice Bucket screen:
    - In the Container Options panel, select the appropriate flow cell type from the Destination Containerdrop-down list.

For Research Use Only. Not for use in diagnostic procedures.

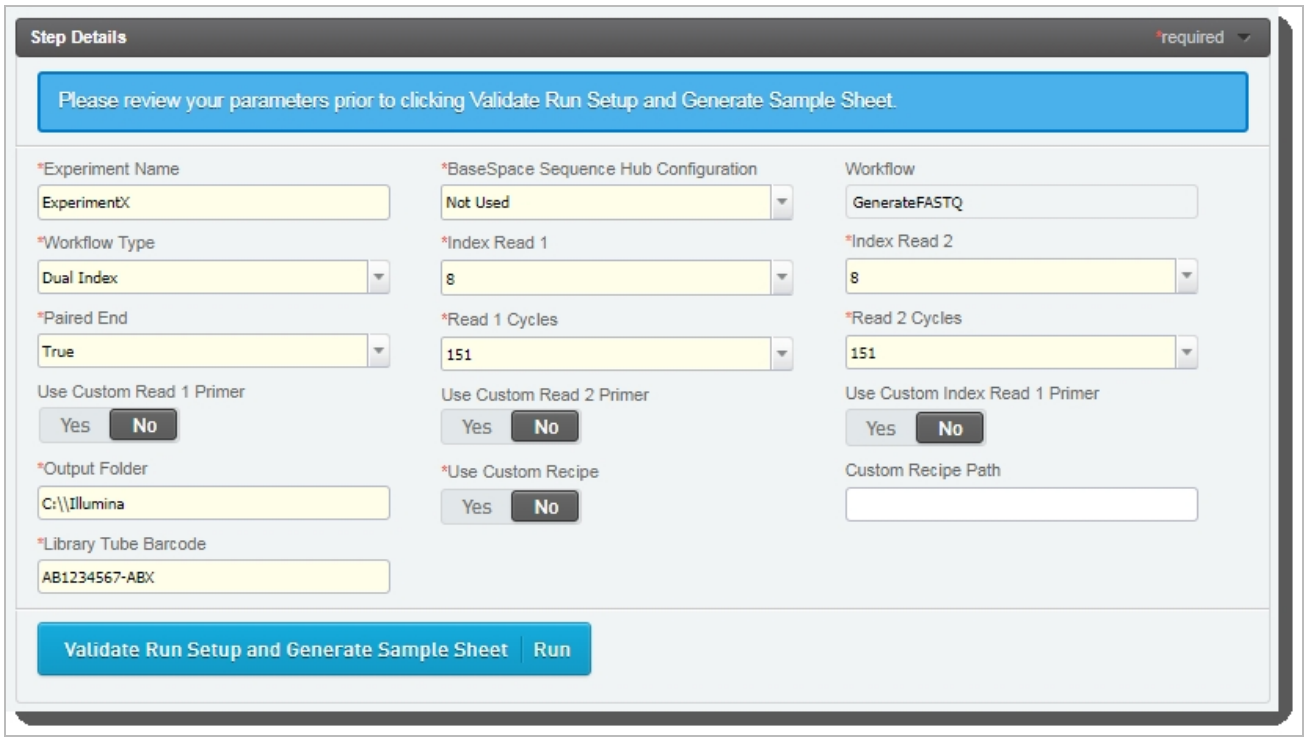


- Click Begin Work.

2. The Validate Inputs and Selected Container automation checks that:
   - The Flowcell Type field has been set to a valid value (SP, S1, S2, or S4), and that all inputs have the same value for this field.
   - The container type selected matches the value in the Flowcell Type field.
   - The number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message informs the user that the number of working pools does not match the number of lanes available on the flow cell.
3. On the Placement screen:
   - Drag the pool(s) from the left of the screen over into the Placed Samples area on the right.

- Scan or type the barcode of the flow cell into the Flow Cell field.

For Research Use Only. Not for use in diagnostic procedures.

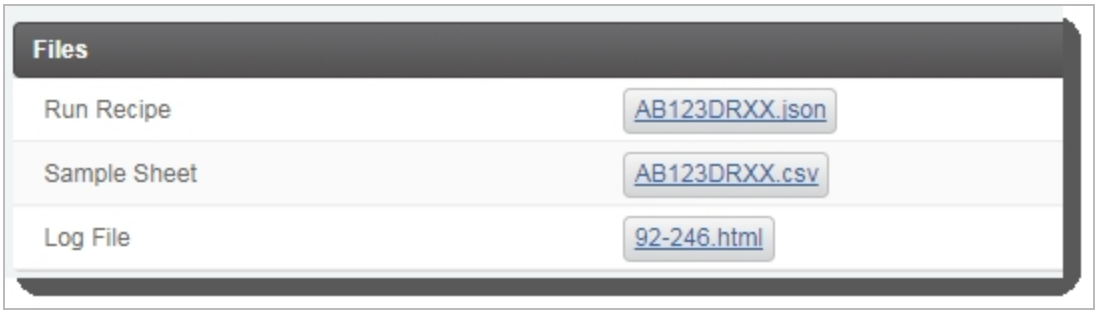


- Click Record Details.

  On exit of the Placement screen, the Validate Flowcell Barcode automation checks that the container barcode conforms to the barcode mask for the selected Flowcell Type, as listed in the following table. This automation also copies the Flowcell Type and Loading Workflow Type field values from step inputs to outputs.

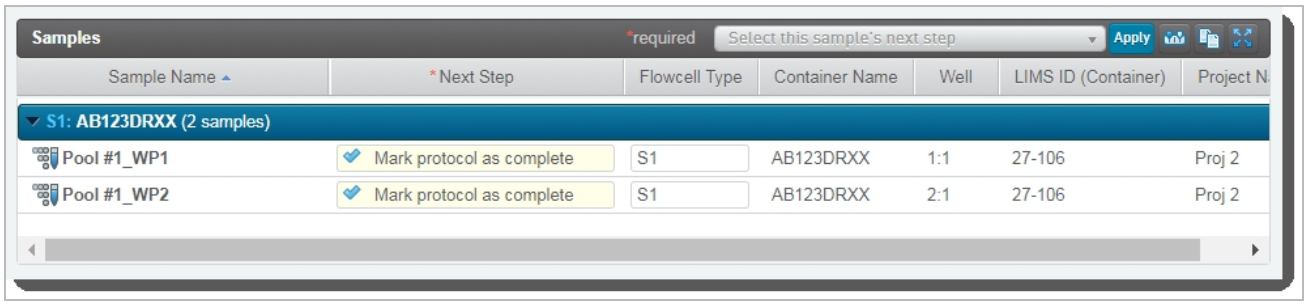
Flow Cell Type	Barcode Mask
SP	[A-Za-z0-9]{5}DRXX
S1	[A-Za-z0-9]{5}DRXX
S2	[A-Za-z0-9]{5}DMXX
S4	[A-Za-z0-9]{5}DSXX

4. The fields displayed on the Record Details screen are used to set up the run and generate the sample sheet.



Some of these fields are auto-populated and some must be completed by the user (see the following table for details).

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Select from preset options: Not Used, Run Monitoring Only, or Run Monitoring and Storage
Workflow	Automatically populated with preset - GenerateFASTQ.
Workflow Type	Select from preset options: No Index, Single Index, Dual Index, or Custom
Index Read 1	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Index Read 2	Select from preset options: 0, 6, or 8 - or type a value between 0 and 20.
Paired End	Select from preset options: True or False
Read 1 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.



For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 2 Cycles	Select from preset options: 251, 151, 101, or 51 - or type a value between 1 and 251. *Value of 251 is only supported for SP flow cell type. For all other flow cell types, maximum value is 151.
Use Custom Read 1 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237.
Use Custom Read 2 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237.
Use Custom Index Read 1 Primer	Select if applicable. LIMS v5.0.5 and later: See *Configuration Update for NovaSeq Integration with Clarity LIMS v5.0.5 and Later* on page 1237.
Output Folder	Enter network path for sequencing run folder. For example: \\networkshare\run_data
Use Custom Recipe	Select if applicable.
Custom Recipe Path	If you selected the Use Custom Recipe option, enter the path to the custom recipe file to be used.
Library Tube Barcode	Scan the library tube barcode.

5. Click Validate Run Setup and Generate Sample Sheet.
    - This triggers the automation script, which: Validates the parameters entered on the Record Details screen.
    - Generates the sample sheet and attaches it to the placeholder in the Files area of the Record Details screen.

    - Click Next Steps.
6. On the Assign Next Steps screen, the Next Step field for samples is pre-populated with Mark protocol as complete.

7. Click Finish Step.

At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.

Proceed to *Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)* on page 908.

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step. The integration will do this automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0)

This protocol contains a single fully-automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0).

The integration starts the step automatically and data from the run is parsed back into the LIMS. No user interaction is required. However, the user may open and review the various stages of the step in the LIMS (see *Review Run Data* on page 908 section below).

By default, the Sequencer API is used to set the next step for output samples.

The PCWP includes a Set Next Steps automation configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step. You can use this automation to override the default next step behavior. See *NovaSeq 6000 Integration v3.2.1 Configuration and User Interaction* on page 798 for details.

Review Run Data

Read summary metrics are recorded for the library pool. Once the run is complete, you can open the step and review these metrics on the Next Steps screen - in the Step Data section and the Sample Details table.

Step Data Section

You should see values populated in the following step UDFs/master step fields:

- Run ID
- Run Status
- Output Folder
- Current Cycle

- Current Read
- Loading Workflow Type
- Flow Cell ID
- Flow Cell Side
- Flow Cell Mode
- Flow Cell Part Number*
- Flow Cell Lot Number
- Flow Cell Expiration Date
- Instrument ID
- Instrument Type
- Instrument Control Software Version
- Firmware Version
- RTA Version
- Sequencing Log

** Part number of all consumables is not available in the payload sent from the NVCS to the LIMS. This issue will be fixed in the upcoming NVCS release.*

Sample Details Table

You should see summary metrics populated in the UDFs/global fields listed below. Values are aggregated across all lanes. Some values - for example Yield PF (Gb) R1 - are summed, while others are averaged.:

- Yield PF (Gb) R1
- Yield PF (Gb) R2*
- Reads PF (M) R1*
- Reads PF (M) R2*
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2

For Research Use Only. Not for use in diagnostic procedures.

- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R2
- % Error Rate R1
- % Error Rate R2

** For R2 Yield, R2 Error rate, and R2 Q30, there are discrepancies between the values shown in the Illumina SAV software and in the payload sent from the NVCS to the LIMS. This issue will be fixed in the upcoming NVCS release.*

How the Integration Works

The following steps summarize how the Sequencer API integration works. For more detailed information, see the *NovaSeq 6000 Integration v3.2.1 Configuration and User Interaction* on page 798.

1. When the user begins setting up a run on the NovaSeq instrument, NVCS sends a request for the run recipe.
   a. The Sequencer API validates that sample(s) and container(s) are correctly queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step.
   b. The LIMS sends a JSON response to NVCS, which includes both the run recipe information and a link that can be used to download the sample sheet that will later be used with analysis software such as bcl2fastq2.
2. When the run starts, NVCS sends a RunStarted run status request. The Sequencer API then:
   - Validates reagent kit information in the RunStarted request:
   – Checks that the reagent kit exists. If it does not, creates it and enables it on the master step.
   – Checks that the reagent kit is activated. If it is not, activates it.
   - Starts the step for the queued sample(s). The step produces one output file placeholder per lane of the flow cell in use, based on the flow cell type.
   - Records all relevant information from the RunStarted request on the step, such as reagent lots and step fields.
3. At the end of the run, NVCS sends one of the following run status requests: RunCompletedSuccessfully, RunEndedByUSer, or RunErroredOut. The Sequencer API then:Updates the step with any new information. Currently, this includes only the status and cycle/read information.
   - Updates the step with any new information. Currently, this includes only the status and cycle/read information.

For Research Use Only. Not for use in diagnostic procedures.

4. Once primary analysis completes, NVCS sends a request containing the parsed run metrics. Note that NVCS sends this only when the run completed successfully, but the API does not make this assumption and will accept the request regardless of status. The Sequencer API then:
    - Records the metrics into the fields on file placeholder outputs in the LIMS.
    - Completes the step in the LIMS if the status is RunCompletedSuccessfully. For all other status options, the step remains in-progress. Note that this is the default autocomplete step behavior. For other configuration options, see the *NovaSeq 6000 Integration v3.2.1 Configuration and User Interaction* on page 798.

The *NovaSeq 6000 Integration v3.2.1 Configuration and User Interaction* on page 798. provides detailed information on how the following components work with the Sequencer API integration:

- Sample sheet generation and contents
- NovaSeq run
- User authentication and login
- Run recipe contents

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, see the following articles:

- *Troubleshooting Automated Informatics* in the Clarity LIMS documentation, Automated Informatics section
- *Troubleshooting EPP/Automation* in the API > Clarity LIMS API Overview > API Advanced Topics section

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq Integration Package by running the following command on the LIMS server command line:
    ```
    rpm -qa | grep -i novaseq
    ```
2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step, review the log file information. See *Logging* on page 912, below.

If the automated run step starts, but does not complete:

1. Use one of the following methods to open the in-progress step in the LIMS:
    - Log in to the default user account.
    - In Lab View, find the step in the Recent Activities sidebar.
    - Search for the step in the LIMS using either the Library Tube or Flow Cell barcode as the search term, depending on whether this is a NovaSeq Standard or NovaSeq Xp run.
2. On the Record Details screen, the Sequencing Log multiline text field will contain logging information.

- If you are unable to reach the Record Details screen, or if the Sequencing Log field does not contain enough information to resolve the issue, review the sequencer-api.log file described below.

3. Contact the BaseSpace Clarity LIMS support team, supplying the relevant information from the troubleshooting steps already performed.

Additional troubleshooting information is provided on the *Illumina Instrument Integrations FAQ* on page 2598 page.

Logging

In addition to updating the Sequencing Log multiline text field on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0) step, the Sequencer API writes a detailed log file to /opt/gls/clarity/tomcat/current/logs/sequencer-api.log.

Log messages include the Library Tube ID and Flow Cell ID whenever the messages are related to a sequencing run-related request. In the LIMS workflows, these IDs are recorded as container names.

Some log messages are not directly related to a sequencing run request, such as downloading the sample sheet. In this case, the file LIMS ID and file name are included in log messages. The sample sheet downloaded by the sequencer will, by default, have a name that includes the sequencing container's ID (Library Tube for Standard or Flow Cell for Xp), so the relevant container name search will find the majority of the log messages for this request as well. However, if you wish to find all messages for downloading a file, then you must know the LIMS ID of the file. You can find this by looking in the LIMS API and, for sample sheets used in a run, in the recipe response (which should also be found in the log file).

Below are some example lines from the log file:

```
2018-06-19 21:32:19.705 INFO --- [] SequencerAPIApplication : Started
SequencerAPIApplication in 7.026 seconds (JVM running for 15.964)
...
2018-06-19 21:34:44.564 INFO --- [Library Tube Id=NV1234567-LIB, Flow Cell
Id=RM123DSXX] LimsApiLookupUtil : Searching for containers with name 'NV1234567-
LIB' or 'RM123DSXX'
....
2018-06-19 21:35:27.158 INFO --- [] FileService : Successfully retrieved file

```

Illumina NovaSeq Integration v3.2.1 Release Notes

Compatibility

- BaseSpace Clarity LIMS v4.2 or later. Not compatible with v6.0 and later.
- NGS Extensions Package v5.18 or later.
- Pre-configured Workflow Package (PCWP) v1.2 or later.

Illumina NovaSeq Software Compatibility

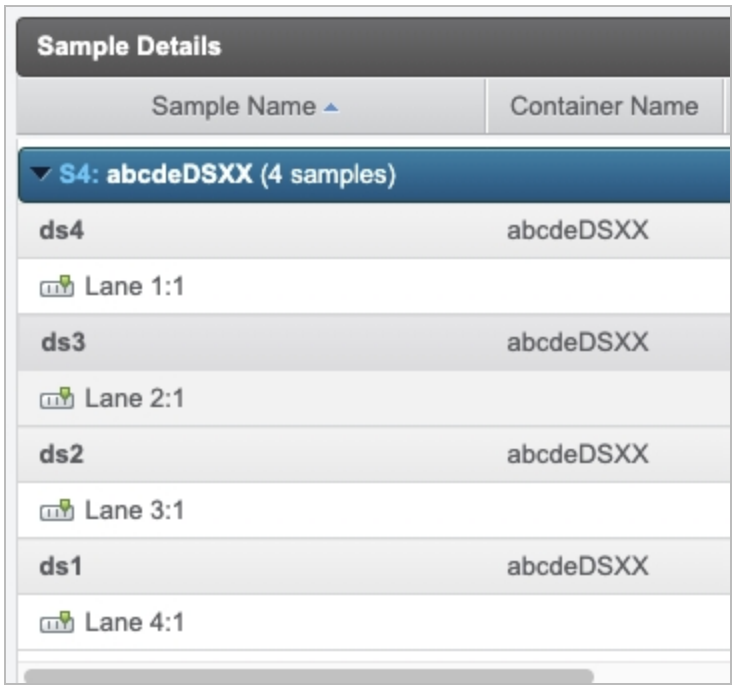
- NovaSeq Control Software (NVCS) v1.6.0.

Features to Note for this Release

This release of the BaseSpace Clarity LIMS integration package provides:

- API-based integration between NovaSeq instrument and BaseSpace Clarity LIMS.
- Support for asymmetric sequencing read length.
- Support for the newly launched SPrime (SP) flowcell.
- Support for long read sequencing (2x250) on SPrime (SP) flowcell.
- Updated workflow (NovaSeq 6000 v3.0) delivered directly from PCWP v1.2
- Direct file and information exchange between Clarity LIMS and NovaSeq Control Software (NVCS) via API includes the following:
  - From LIMS to NVCS:
    - Sample sheet generated on LIMS to NVCS
    - Run recipe generated on LIMS to NVCS
  - From NVCS to LIMS:
    - Run status updates (RunStarted, RunCompletedSuccessfully, RunEndedByUser, RunErroredOut) from NVCS to LIMS
    - Run metrics information from NVCS to LIMS

Known issues

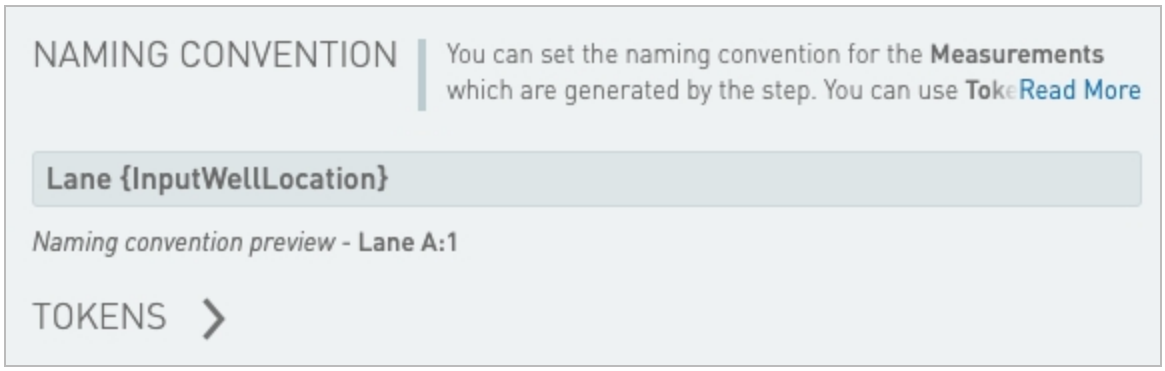


- In the run metrics payload that NVCS v1.6.0 sends to Clarity LIMS:
  - ReadsPF information is currently not available. (This will be fixed in the upcoming NVCS release.)
  - R2 error rate, R2 Q30, and R2 yield have slight inconsistency compared to values on Illumina Sequencing Analysis Viewer (SAV) software.

Migrate NovaSeq 6000 v3.0 Configuration to Display the Correct Lane Number

Recommended Usage: For users implementing the NovaSeq 6000 v3.0 workflow.

This solution provides a way to fix the incorrect lane number display without any software upgrades, by using the "InputWellLocation" token instead of "OutputItemNumber." However, it is not a perfect solution, since the sample details will display both container row and column numbers.



Here is an illustration of the result:

Instructions

To resolve this issue, you must update the “Naming Convention” configuration for master step: AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0).

1. Log into BaseSpace Clarity LIMS with System Administrator permissions.
2. In the Configuration area, click LAB WORK, and then choose master step AUTOMATED - NovaSeq Run (NovaSeq 6000 v3.0).
3. In Naming Convention, change the value to `Lane {InputWellLocation}`.

4. Click Save.

NovaSeq 6000 Integrations v2

The Illumina NovaSeq 6000 instrument integration provides preconfigured workflows that map to established lab protocols and steps used with NovaSeq instruments. The integration also supports the associated library prep kits, reagent kits, and assays used in these protocols.

The documents in this section support Illumina NovaSeq 6000 Integration version 2.x.

NovaSeq 6000 Integration v2.5 Configuration & User Interaction

The Illumina NovaSeq 6000 Integration Package v2.5 supports the integration of Clarity LIMS to NovaSeq 6000 instruments.

This document describes the integration and includes information about the preconfigured protocols, steps, automations, installed components, configuration requirements, rules, and constraints.

For instructions on validating and troubleshooting the Illumina NovaSeq 6000 Integration, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

> The configuration provided in this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows—including renaming protocols, steps, and fields—could break the process.

Integration Functionality

The integration includes the following functionality:

- Preconfigured NovaSeq 6000 v2.3 workflow that maps to lab protocols and instrument runs.
- Preconfigured NovaSeq Standard (NovaSeq 6000 v2.3) protocol that supports the loading of pooled libraries into a library tube.
- Preconfigured NovaSeq Xp (NovaSeq 6000 v2.3) protocol that supports individual lane loading on the NovaSeq.
- Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software.
- Automatic generation of run recipe file (JSON format) that is automatically uploaded to the sequencing instrument and used to set up and initiate the run.
- Automated tracking of the NovaSeq sequencing run and parsing of run statistics (per run per lane) into Clarity LIMS, including:
  - Progress and metrics of sequencing run

  - Per instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Real-Time Analysis v3 (RTA3) run directory location and other run-specific information
- Preconfigured NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow used for validation purposes only. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v2.3 workflow. For details, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

Prerequisites and Assumptions

It is assumed that samples enter the NovaSeq 6000 v2.3 workflow as normalized libraries. That is, before they are assigned to the workflow the following actions occur:

- Samples have been accessioned into Clarity LIMS.
- Samples have been run through QC and library prep.
- Samples have been normalized, and the value is captured in a field called Normalized Molarity (nM).

For more information on sample accessioning, refer to *Sample Accessioning* and *Upload and Modify Samples* in the Getting Started section of the Clarity LIMS Core Functionality documentation.

You can assign samples to workflows automatically, using a routing script, or manually—from the Projects & Samples dashboard. Refer to *Assign and Process Samples* in the Clarity LIMS Core Functionality documentation.

Workflows, Protocols, and Steps

The Illumina NovaSeq 6000 Integration Package v2.5 includes two workflows:

- NovaSeq 6000 v2.3
- NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)

The following table lists and describes the protocols and steps included in these workflows.

Table 217 NovaSeq 6000 Integration Package v2.5 Protocols and Steps

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow		

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)	Included for validation purposes only, this protocol models the library prep steps required to advance samples to the Run Format (NovaSeq 6000 v2.3) protocol. The protocol contains a single step: NovaSeq Validation Library Prep (NovaSeq 6000 v2.3). At the end of this step, a routing script sends the samples to the first step of the NovaSeq 6000 v2.3 workflow, which is Define Run Format (NovaSeq 6000 v2.3).	NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)
	NovaSeq 6000 v2.3 workflow	
Run Format (NovaSeq 6000 v2.3)	Allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). • Loading Workflow Type: Select from NovaSeq Standard or NovaSeq Xp. • Normalized Molarity: Enter a value for each sample. • Flowcell Type: Select from options S1, S2, S4, and SP. • Final Loading Concentration (pM): Select from the options 225 (PCR-free workflows) or 400 (Nano workflows). Alternatively, enter a different value. Compares the Normalized Molarity value of each sample with the Minimum Molarity value. Routing script sends samples to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type. Samples with Normalized Molarity less than Minimum Molarity are removed from the workflow.	Define Run Format (NovaSeq 6000 v2.3)
NovaSeq Standard (NovaSeq 6000 v2.3)	Samples are pooled and added to the library tube in preparation for the NovaSeq run. Sample sheet and run recipe files are generated. Routing script sends library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) protocol.	Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) Dilute and Denature (NovaSeq 6000 v2.3)

Protocol Name	Protocol Purpose	Protocol Steps
NovaSeq Xp (NovaSeq 6000 v2.3)	Samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v2.3) step. Sample sheet and run recipe files are generated. Samples are queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) protocol.	Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) Load to Flowcell (NovaSeq 6000 v2.3)
AUTOMATED - NovaSeq Run (NovaSeq6000 v2.3)	All samples complete the workflow by going through this protocol. This protocol contains one fully automated step. Do not add samples to the Ice Bucket or start the step. The integration does this action automatically.	AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)

Validation Workflow

The NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow allows for validation of the system after installation is complete. For details, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

Step Automations

The following table lists the step automations included in the NovaSeq 6000 v2.3 workflow. Automation details are provided in the sections following the table.

For details on the validation workflow, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

Table 218 NovaSeq 6000 v2.3 Workflow Step Automations

Protocol	Step	Automation
1. Run Format (NovaSeq 6000 v2.3)	1. Define Run Format (NovaSeq 6000 v2.3)	• Routing Script • Set Next Steps
2. NovaSeq Standard (NovaSeq 6000 v2.3)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute and Denature (NovaSeq 6000 v2.3)	• Generate Sample Sheet & Run Recipe • Prepare Files for NovaSeq • Routing Script • Validate Library Tube Barcode • Validate Single Input
3. NovaSeq Xp (NovaSeq 6000 v2.3)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type and Single Pool • Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)
	2. Dilute, Denature & ExAmp (NovaSeq 6000 v2.3)	• Calculate Volumes • Set Next Step • Validate Inputs Flowcell Type
	3. Load to Flowcell (NovaSeq 6000 v2.3)	• Generate Sample Sheet & Run Recipe • Prepare Files for NovaSeq • Validate Flowcell Barcode • Validate Inputs and Selected Container
4. AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)	• Parse Run Parameters and Generate Link to Run Folder • Read InterOp Metrics • Set Next Steps • Update Lane number

For Research Use Only. Not for use in diagnostic procedures.

Protocol 1: Run Format (NovaSeq 6000 v2.3)

This protocol sets the Loading Workflow Type and allows you to choose the appropriate Flowcell Type and Final Loading Concentration(pM). At the end of the protocol, a routing script sends the normalized libraries to either the NovaSeq Standard (NovaSeq 6000 v2.3) or the NovaSeq Xp (NovaSeq 6000 v2.3) protocol.

This protocol contains one step: Define Run Format (NovaSeq 6000 v2.3).

Step 1: Define Run Format (NovaSeq 6000 v2.3)

Step input: NTP (normalized libraries)

Step output: None

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, this automation does the following actions:

- Sets the next step for samples to REMOVE with `nextStep = ::REMOVE::.`
- Calculates the Minimum Molarity using the following formula:

```
input.::Minimum Molarity (nM):: = (5 * input.::Final Loading Concentration
(pM)::)/1000
```

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, an empty value, not including 0), the automation generates an error message stating that the field cannot be empty:

```
if (!input.hasValue(::Normalized Molarity (nM)::)) { fail(::The Normalized
Molarity cannot be empty.::) ; }
```

- Compares the Normalized Molarity value of each sample with the Minimum Molarity value. If Normalized Molarity value is lower than the Minimum Molarity value, sets the Loading Workflow Type of the sample to [Remove from workflow] and records a message in the Warning field:

```
else if (input.::Normalized Molarity (nM):: < input.::Minimum Molarity (nM)::) {
input.::Warning:: = ::The Normalized Molarity is too low.:: ; input.::Loading
Workflow Type:: = ::[Remove from workflow]:: ; } else { input.::Warning:: =
::n/a:: }
```

  At this point, there are two options:

  - Correct the Normalized Molarity value on the Record Details screen. Also, edit the Loading Workflow Type field and set it to NovaSeq Standard or NovaSeq Xp, as applicable.
  - Complete the protocol without correcting the Normalized Molarity value. In this case, those samples are removed from the workflow.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step inputs appropriately.

- Samples with Loading Workflow Type field value of NovaSeq Standard are routed to the NovaSeq 6000 v2.3 workflow and queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step.
- Samples with Loading Workflow Type field value of NovaSeq Xp are routed to the NovaSeq 6000 v2.3 workflow and queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step.

The default automation command line is as follows.

```
bash -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-
common/v5/EPP/ngs-extensions.jar
-u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid0}
script:changeWorkflow \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Standard' \
--WORKFLOW 'NovaSeq 6000 v2.3' \
--STEP 'Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)' \
--INPUTS_OR_OUTPUTS 'INPUTS' \
\
--FIELD_NAME 'Loading Workflow Type' \
--FIELD_VALUE 'NovaSeq Xp' \
--WORKFLOW 'NovaSeq 6000 v2.3' \
--STEP 'Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)' \
--INPUTS_OR_OUTPUTS 'INPUTS'"
```

Master Step Fields

The following table provides field configuration details for the fields defined on the Define Run Format (NovaSeq 6000 v2.3) step.

Table 219 Define Run Format (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Comment	Multiline Text		None

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Instruction	Text	Read Only	Default • Add Flowcell Type and Loading Workflow Type below
Flowcell Type	Text Dropdown	Required Field Custom Entries	Hidden (does not show on Record Details screen) Presets • S1 • S2 • S3 • S4
Loading Workflow Type	Text Dropdown	Required Field	Hidden (does not show on Record Details screen) Presets • NovaSeq Standard • NovaSeq Xp

Global Fields

The following table lists the global fields that are configured to display on the Define Run Format (NovaSeq 6000 v2.3) step.

Table 220 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Dropdown Items
Configured on Derived Sample			
Adjusted Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Dropdown Items
Final Loading Concentration (pM)	Numeric Dropdown	Required Field Custom Entries	Presets • 225 • 400 Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • S1 • S2 • S4 • SP
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Minimum Molarity (nM)	Numeric		Decimal places displayed = 2
Normalized Molarity (nM)	Numeric		Decimal places displayed = 2
Per Sample Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Warning	Text Dropdown	Read Only Custom Entries	Presets • The Normalized Molarity (nM) is too low. • n/a

User Interaction

1. On the Record Details screen in the Sample Details table, complete the following fields (values can vary across samples):
   - **Loading Workflow Type**—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - **Flowcell Type**—Select S1, S2, S4, or SP from the drop-down list.
   - **Final Loading Concentration (pM)**—Select from the two preset options (225 (for PCR-free workflows) or 400 (for Nano workflows)) or enter a different value.

- **Normalized Molarity**—Enter a value for each sample.

2. Select Next Steps.
   This selection triggers the Set Next Steps automation, which does the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
   - Calculates the Minimum Molarity.
   - Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, an empty value, not including 0), the automation generates an error message stating that the field cannot be empty.
   - Compares the Normalized Molarity value of each sample with the Minimum Molarity value.
3. On the Assign Next Steps screen, observe the following changes:
   - In the Sample Details table, the Next Step for all samples is prepopulated with Remove from workflow—regardless of the Loading Workflow Type.

     Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

   - For samples whose Normalized Molarity value is lower than the Minimum Molarity value, the Loading Workflow Type is set to Remove from workflow and a message is recorded in the Warning field for the sample.
4. [Optional] If the Normalized Molarity value is lower than the Minimum Molarity value, complete one of the following options:
   - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. Also, set the Loading Workflow Type to NovaSeq Standard or NovaSeq Xp.
   - Complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
5. Select Finish Step.
   The Routing Script automation is triggered when:
   - Samples where Loading Workflow Type is set to Remove from workflow (eg, where Normalized Molarity value is lower than the Minimum Molarity) are removed from the Clarity LIMS workflow.
   - Samples where Loading Workflow Type is set to NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step. This step is the first of two steps in the NovaSeq Standard (NovaSeq 6000 v2.3) protocol.
   - Samples where Loading Workflow Type is set to NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step. This step is the first of three steps in the NovaSeq Xp (NovaSeq 6000 v2.3) protocol.

Protocol 2: NovaSeq Standard (NovaSeq 6000 v2.3)

Samples are routed to this protocol if the Loading Workflow Type value is set to NovaSeq Standard. Samples are pooled and added to a library tube in preparation for the NovaSeq run.

At the end of this protocol, a routing script sends the library tube to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) protocol.

This protocol contains two steps:

1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)
2. Dilute and Denature (NovaSeq 6000 v2.3)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)

In this step, manually place libraries into a single pool. Resuspension buffer and reagents are added.

> Only create one pool per step.

Step input: NTP (normalized libraries)

Step output: Bulk pool

The following automations are configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling)

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation checks the following information:

- All samples in the pool have the same Flowcell Type assigned to them.
- Only one pool has been created.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/novaseq/novaseq-extensions.jar script:validate_flowcell_for_input_pools -i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -validateSingleOutput true -poolType bulk
```

Calculate Volumes Automation

Due to the 4000-character limit, part of the script definition of Calculate Volumes has been moved into the Calculate Volumes Script field. If this part of the script needs to be modified, you can make the changes to the default value of the Calculate Volumes Script field. The parts of the script that were moved into the Calculate Volumes Script field are identified below.

Automatically triggered when the Calculate Volumes button on the Record Details screen is selected, this automation does the following actions:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) fields, based on the selected Flowcell Type. The following part of the automation is found in the Calculate Volumes Script field:

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6
};
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9
};
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9
};
if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = ::::
};
```

- Calculates the Per Sample Volume (µl) to be added to the pool. The following part of the automation is found in the Calculate Volumes Script field:

```
input.::Per Sample Volume (µl):: = ( ( (input.::Final Loading Concentration
(pM):: * 5 / 1000) / input.::Normalized Molarity (nM):: ) * step.::Bulk Pool
Volume (µl):: ) / step.::Number of Samples in Pool::
```

For Research Use Only. Not for use in diagnostic procedures.

To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value is set at 5, which can be edited.

Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:

1. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the Adjusted Per Sample Volume (µl) field.
2. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;output.::Loading Workflow
Type::= input.::Loading Workflow Type::;
```

- Sets the Volume of Pool to Denature (µl) value and calculates NaOH Volume (µl) and Tris-HCl Volume (µl) values, based on the Flowcell Type:

```
step.::PhiX Volume (ul):: = !step.hasValue('% PhiX (2.5nM) Spike-In') ? 0 :
step.'% PhiX (2.5nM) Spike-In';
if (input.::Flowcell Type:: == ::SP::) {
output.::Volume of Pool to Denature (ul):: = 100;
output.::NaOH Volume (ul):: = 25;
output.::Tris-HCl Volume (ul):: = 25;
}
if (input.::Flowcell Type:: == ::S1::) {
output.::Volume of Pool to Denature (ul):: = 100;
output.::NaOH Volume (ul):: = 25;
output.::Tris-HCl Volume (ul):: = 25;
}
if (input.::Flowcell Type:: == ::S2::) {
output.::Volume of Pool to Denature (ul):: = 150;
output.::NaOH Volume (ul):: = 37;
output.::Tris-HCl Volume (ul):: = 38;
```

```
}
if (input.::Flowcell Type:: == ::S4::) {
output.::Volume of Pool to Denature (ul):: = 310;
output.::NaOH Volume (ul):: = 77;
output.::Tris-HCl Volume (ul):: = 78;
}
```

- Uses the `NovaSeq_Standard_Bulk_Pool1.csv`, `NovaSeq_Standard_Bulk_Pool2.csv`, and `NovaSeq_Standard_Bulk_Pool3.csv` template files to generate a single CSV file containing information about the pool and the samples it contains. The generated file is available for download on the Step Setup screen of the following step: Dilute and Denature (NovaSeq 6000 v2.3).

```
script:driver_file_generator \ -t
/opt/gls/clarity/extensions/novaseq/templates/NovaSeq_Standard_Bulk_Pool1.csv \
-o 1.csv \ script:driver_file_generator \ -t
/opt/gls/clarity/extensions/novaseq/templates/NovaSeq_Standard_Bulk_Pool2.csv \
-o 2.csv \ script:driver_file_generator \ -t
/opt/gls/clarity/extensions/novaseq/templates/NovaSeq_Standard_Bulk_Pool3.csv \
-o 3.csv \&& cat 1.csv 2.csv 3.csv > {compoundOutputFileLuid0}.csv
```

- Resets the Total Sample Volume (ul) and Number of Samples in Pool field values so that the automation is idempotent:

```
step.'Number of Samples in Pool' = step.'Number of Samples in Pool' - 1;
step.'Total Sample Volume (ul)' = step.'Total Sample Volume (ul)' -
input.'Adjusted Per Sample Volume (ul)'
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step for samples to ADVANCE, advancing them to the Dilute and Denature (NovaSeq 6000 v2.3) step in the protocol:

```
nextStep = ::ADVANCE::
```

Master Step Fields

The following table provides field configuration details for the fields defined on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step.

Table 221 Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
% PhiX (2.5nM) Spike-In	Numeric		Range = 1–100 Decimal places displayed = 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (uL)	Numeric	Required Field	Default • 5 Decimal places displayed = 2
Number of Flowcells to Sequence	Numeric	Required Field	Range = 1–10 Decimal places displayed = 0
Number of Samples in Pool (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 2
Calculate Volumes Script	Text	Required Field Read Only	Default value provided in the drop-down section following the table. Do not remove this field. It is used by the Calculate Volumes automation script.

For Research Use Only. Not for use in diagnostic procedures.

Calculate Volumes Script

```
step.::PhiX Volume (ul):: = !step.hasValue(::% PhiX (2.5nM) Spike-In::) ? 0 :
step.::% PhiX (2.5nM) Spike-In::; if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 100;
step.::PhiX Volume (ul):: *= 0.6 }; if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 150;
step.::PhiX Volume (ul):: *= 0.9 }; if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (ul):: = step.::Number of Flowcells to Sequence:: * 310;
step.::PhiX Volume (ul):: *= 1.9 }; if (step.::PhiX Volume (ul):: == 0) {
step.::PhiX Volume (ul):: = :::: }; input.::Per Sample Volume (ul):: =
(((input.::Final Loading Concentration (pM):: * 5 / 1000) / input.::Normalized
Molarity (nM)::) * step.::Bulk Pool Volume (ul)::) / step.::Number of Samples in
Pool::
```

Global Fields

The following table lists the global fields that are configured to display on the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step.

Table 222 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • S1 • S2 • S4 • SP
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

Field Name	Field Type	Options	Additional Options and Drop-Down Items
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Volume of Pool to Denature (µl) (Used in Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step only. Displays on Record Details screen and in the generated CSV file.)	Numeric	Read Only	Decimal places displayed = 0

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen, create a pool as follows.
   a. Create a pool by dragging samples into the Pool Creator.
   b. Name the pool or accepts the default name (Pool #1).
   c. Select Record Detail.

   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type and only one pool has been created.
4. On the Record Details screen in the Step Details area, complete the fields as follows.
   a. Enter the value for the Number of Flowcells to Sequence field.
      This value is used in volume calculations to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   b. Enter the value for the Minimum Per Sample Volume (µl) field.
      The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl), but the value can be edited if necessary.
   c. If necessary, enter the value for the % PhiX (2.5 nM) Spike-In field.

For Research Use Only. Not for use in diagnostic procedures.

The value in this field is used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

5. In the Sample Details table, select the pool icon to view details on the pool composition.
6. Select Calculate Volumes.
   This selection triggers the Calculate Volumes automation, which performs the following volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Populates the Volume of Pool to Denature (µl), NaOH Volume (µl), and Tris-HCl Volume (µl) columns of the Sample Details table. (Values are set by a script and are not editable.)
   - Generates the Calculation File (CSV) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select the file to download it, then open it in Excel.
7. Select Next Steps.
   This selection triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol: Dilute and Denature (NovaSeq 6000 v2.3).
   On the Assign Next Steps screen, the next step is already set to Dilute and Denature (NovaSeq 6000 v2.3).
8. Select Finish Step.
   At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v2.3) step.

Step 2: Dilute and Denature (NovaSeq 6000 v2.3)

In this step, pooled samples are denatured and diluted by the addition of NaOH, Tris-HCl, and Resuspension Buffer (RSB). Samples are manually placed into the library tube that is used in the NovaSeq run. In addition, this step generates the sample sheet file and the run recipe (*json file) needed to start the NovaSeq run. The step input is Bulk pool, and the step output is Library tube.

The following automations are configured on the step:

- Generate Sample Sheet & Run Recipe
- Prepare Files for NovaSeq
- Routing Script

For Research Use Only. Not for use in diagnostic procedures.

- Validate Library Tube Barcode
- Validate Single Input

Validate Single Input Automation

Automatically triggered at the beginning of the step, the following automation checks that there is only one container input to the step:

```
script:validateSampleCount -min 1 -max 1
```

Validate Library Tube Barcode Automation

Automatically triggered on exit of the Placement screen, the following automation validates the library tube barcode to make sure it conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}:

```
if (!output.container.name.matches(::[A-Z]{2}[0-9]{7}-[A-Z]{3}::)
fail(::Invalid Library Tube Barcode. Please verify and try again.::)
}
```

Generate Sample Sheet & Run Recipe Automation

Automatically triggered when a button on the Record Details screen is selected, this automation does the following actions:

- Copies the Flowcell Type from the step input to the step output:

```
output.::Flowcell Type:: = input.::Flowcell Type::
```

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Copies the Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Loading Workflow Type:: = input.::Loading Workflow Type::;
```

- Validates the parameters entered on the Record Details screen:
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type is No Index, Index Read 1 must be zero. For any other Workflow Type, Index Read 1 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
}
if(step.::Workflow Type::== ::No Index::) {
if(step.::Index Read 1::!= 0) {
fail(::Index Read 1 must be 0 if the Workflow Type is No Index.::)
}
```

For Research Use Only. Not for use in diagnostic procedures.

```
} else {
if(step.::Index Read 1::== 0) {
fail(::Index Read 1 must be greater than 0 if the Workflow Type is ::+
step.::Workflow Type::+ ::.::)
}
}
```

- When Paired End is True, Index Read 1 and Index Read 2 must be greater than zero.
- When Paired End is False, Index Read 2 must be zero, Reverse Complement Workflow must be false, UMI - Read 2 Length must not have a value, and UMI - Read 2 Start from Cycle must not have a value.

```
if (step.::Paired End::.toBoolean()) {
if (step.::Read 1 Cycles:: == 0 || step.::Read 2 Cycles:: == 0) {
fail(::Read 1 Cycles and Read 2 Cycles must be greater than 0 if Paired End is
True.::);
}
} else {
if (step.::Read 2 Cycles:: != 0) {
fail(::Read 2 Cycles must be 0 if Paired End is False.::);
}
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {
fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle cannot be defined
if Paired End is False.::);
}
}
```

- Validates allowed read cycles to be not greater than 151 if the Flowcell Type is not SP.

```
if (input.::Flowcell Type:: != ::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime
Flowcell.::);
}
if (input.::Flowcell Type:: != ::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime
Flowcell.::);
}
```

- Validates allowed value for UMI - Read 1 Length, UMI - Read 2 Length, UMI - Read 1 From Cycle, UMI - Read 2 From Cycle.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
```

For Research Use Only. Not for use in diagnostic procedures.

```
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::);
}
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::);
}
```

- Sets the next step for samples to REMOVE.

```
nextStep = ::REMOVE::
```

- Generates the sample sheet and the run recipe file and attaches them to the step. For details on how the files are generated and their contents, refer to *Sample Sheet and Run Recipe File Generation* on page 969.

Prepare Files for NovaSeq Automation

Automatically triggered on exit of the Record Details screen, this automation invokes the `copy_attachments_to_network_folder` script, which is included in the `novaseq-remote-extensions.jar` file. This script places the generated sample sheet and run recipe (*json file) into the appropriate folder on the NAS, where the instrument uses them to start the run.

For more information, refer to *Sample Sheet and Run Recipe File Generation* on page 969.

Routing Script Automation

Automatically triggered on exit of the step, this automation invokes the changeWorkflow script, which routes step outputs to the NovaSeq 6000 v2.3 workflow, and queues them for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step.

The default automation command line is as follows.

```
bash -l -c "/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/ngs-common/v5/EPP/ngs-extensions.jar -u {username} -p {password} -i {stepURI:v2} -l {compoundOutputFileLuid2} script:changeWorkflow \
\
--FIELD_NAME 'N/A' \

```

Master Step Fields

The following table provides field configuration details fields defined on the Dilute and Denature (NovaSeq 6000 v2.3) step. These fields are required for sample sheet and JSON file generation.

Table 223 Dilute and Denature (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Sample Sheet Path	Text	Read Only	
UMI - Read 1 Length	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 1 Start From Cycle	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 2 Length	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 2 Start From Cycle	Numeric		Range = 1 Decimal places displayed = 0
Use Custom Index Read 1 Primer	Toggle Switch		Default • No
Use Custom Read 1 Primer	Toggle Switch		Default • No
Use Custom Read 2 Primer	Toggle Switch		Default • No
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index

Global Step Fields

The following table lists the global step fields that are configured to display on the Dilute and Denature (NovaSeq 6000 v2.3) step.

Table 224 Global Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • S1 • S2 • S4 • SP
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User interaction

1. On the Placement screen, move the pool as follows.
   a. Drag the pool into the library tube in the Placed Samples area.
   b. Scan or types the barcode of the library tube into the Library Tube field.
   c. Select Record Details.
   On exit of the Placement screen, the Validate Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}. If not, an error message displays.
2. On the Record Details screen:
   - The Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. Select from the active lots displayed in each drop-down list.

     To make reagent lots available for selection in the Reagent Lot Tracking section, configure and activate them. Do this step on the Configuration > Consumables screen.

   - The fields displayed in the Step Details section are used to generate the sample sheet and run recipe files. Some of these fields are autopopulated and some must be completed manually (refer to the following table for details).

For Research Use Only. Not for use in diagnostic procedures.

Table 225 Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeq 6000 v2.3) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 1 and 251 for the SP flow cell type or between 1 and 151 for all other types

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 0 and 251 for the SP flow cell type or between 0 and 151 for all other types
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Sample Sheet Path	Automatically populated after the sample sheet has been generated.

3. Select Generate Sample Sheet & Run Recipe.
   This selection triggers the automation script, which does the following actions:
   - Generates the sample sheet and JSON files and attaches them to the placeholders in the Files area of the Record Details screen.
   - Populates the Sample Sheet Path field with the path to the sample sheet file.
   - Sets the value of the next step to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
4. Select Next Steps.
   This selection triggers the Prepare Files for NovaSeq automation, which copies the sample sheet and run recipe files to the location specified during installation.

5. On the Assign Next Steps screen, make sure the Next Step for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

6. Select Finish Step.
   This will trigger the Routing Script automation and route samples to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) protocol. In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step and data from the run is parsed back into Clarity LIMS.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v2.3)

Samples are routed to this protocol if the Loading Workflow Type value is set to NovaSeq Xp.

Samples are pooled and added to lanes on the NovaSeq flow cell type selected in the Define Run Format (NovaSeq 6000 v2.3) step.

At the end of the protocol, a routing script sends the flow cell to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) protocol.

This protocol contains three steps:

1. Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)
2. Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v2.3)
3. Step 3: Load to Flowcell (NovaSeq 6000 v2.3)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)

In this step, the libraries are manually placed into a pool. The step input is NTP (normalized libraries) and the step output is Bulk pool.

Only create one pool per step.

The following automation is configured on the step:

- Calculate Volumes
- Set Next Step
- Validate Inputs Flowcell Type and Single Pool
- Validate Unique Indexes (Not used. This functionality is handled by the core Clarity LIMS configuration for pooling.)

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type and Single Pool Automation

Automatically triggered on exit of the Pooling screen, this automation checks the following information:

- All samples in the pool have the same Flowcell Type assigned to them.
- Only one pool has been created.

```
/opt/gls/clarity/bin/java -jar /opt/gls/clarity/extensions/novaseq/novaseq-
extensions.jar script:validate_flowcell_for_input_pools
-i {stepURI:v2} -u {username} -p {password} -l {compoundOutputFileLuid1} -
validateSingleOutput true
```

Calculate Volumes Automation

Automatically triggered when the Calculate Volumes button on the Record Details screen is selected, this automation:

- Calculates the number of samples in the pool:

```
step.::Number of Samples in Pool:: = step.::Number of Samples in Pool:: + 1
```

- Sets the value of the Bulk Pool Volume (µl) and PhiX Volume (µl) field, based on the selected Flowcell Type:

```
step.::PhiX Volume (µl):: = !step.hasValue(::% PhiX (0.25nM) Spike-In::) ? 0 :
step.::% PhiX (0.25nM) Spike-In::;
if (input.::Flowcell Type:: == ::SP::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (µl):: *= 0.7;
}
if (input.::Flowcell Type:: == ::S1::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 18;
step.::PhiX Volume (µl):: *= 0.7;
}
if (input.::Flowcell Type:: == ::S2::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 22;
step.::PhiX Volume (µl):: *= 0.8;
}
if (input.::Flowcell Type:: == ::S4::) {
step.::Bulk Pool Volume (µl):: = step.'Number of Lanes to Sequence' * 30;
step.::PhiX Volume (µl):: *= 1.1;
}
if (step.::PhiX Volume (µl):: == 0) {
step.::PhiX Volume (µl):: = '';
}
```

- Calculates the Per Sample Volume (µl) to be added to the pool:

```
input.::Per Sample Volume (µl)::= (((input.::Final Loading Concentration (pM)::*
5/ 1000) / input.::Normalized Molarity (nM)::) * step.::Bulk Pool Volume (µl)::)
/ step.::Number of Samples in Pool::
```

> To ensure accurate pipetting of each sample in a pool for sequencing, the Per Sample Volume (µl) value must be equal to or higher than the Minimum Per Sample Volume (µl). The default value set at 5 and can be edited.
>
> Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
>
> 1. If the smallest Per Sample Volume (µl) value is less than 5, Clarity LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (µl) field.
> 2. Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

- Calculates the Total Sample Volume (µl) field value:

```
step.::Total Sample Volume (µl):: = step.::Total Sample Volume (µl):: +
input.::Adjusted Per Sample Volume (µl)::
```

- If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) field value:

```
if (step.::Total Sample Volume (µl):: >= step.::Bulk Pool Volume (µl)::)
{output.::RSB Volume (µl):: = 0} else {output.::RSB Volume (µl):: = step.::Bulk
Pool Volume (µl):: - step.::Total Sample Volume (µl)::} ;
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Bulk_Pool.csv` and `NovaSeq_Xp_Bulk_Pool2.csv` template files to generate a single CSV file containing information about the bulk pool and the samples it contains. The generated file is available for download on the Step Setup screen of the following step—Dilute, Denature & ExAmp (NovaSeq 6000 v2.3).
- Resets the Total Sample Volume (ul) and Number of Samples in Pool field values so that the automation is idempotent:

```
step.'Number of Samples in Pool' = step.'Number of Samples in Pool' - 1;
step.'Total Sample Volume (ul)' = step.'Total Sample Volume (ul)' -
input.'Adjusted Per Sample Volume (ul)'
```

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation does the following actions:

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table provides field configuration details for the fields defined on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step.

Table 226 Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
% PhiX (0.25nM) Spike-In	Numeric		Range = 0–100 Decimal places displayed = 0
Bulk Pool Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Minimum Per Sample Volume (µl)	Numeric	Required Field	Default • 5 Decimal places displayed = 2
Number of Lanes to Sequence	Numeric	Required Field	Decimal places displayed = 0
Number of Sample in Pool (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0
PhiX Volume (µl) (for calculation purposes, not displayed)	Numeric		Decimal places displayed = 2
Total Sample Volume (µl) (for calculation purposes, not displayed)	Numeric		Default • 0 Decimal places displayed = 0

Global Fields

The following table lists the global fields that are configured to display on the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step.

Table 227 Global Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Derived Sample			
RSB Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Flowcell Type	Text Dropdown	Required Field	Presets • S1 • S2 • S4 • SP
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]

User Interaction

1. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, select Begin Work.
3. On the Pooling screen, create a pool as follows.
   a. Drag samples into the Pool Creator to create a pool.
   b. Name the pool or accept the default name Pool #1.
   c. Select Record Details.

   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks that all samples in the pool have been assigned the same Flowcell Type and only one pool has been created.
4. On the Record Details screen in the Step Details area, complete the fields as follows.
   a. Enter the value for the Number of Lanes to Sequence field.
      This value is used in volume calculations to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   b. Enter the value for the Minimum Per Sample Volume (µl) field.

For Research Use Only. Not for use in diagnostic procedures.

The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl), but the value can be edited if necessary.

c. If necessary, enter the value for the % PhiX (0.25 nM) Spike-In field.
The value in this field is used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

5. In the Sample Details table, select the pool icon to view details on the pool composition.
6. Select Calculate Volumes.
This selection triggers the Calculate Volumes automation, which performs the following volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - If % PhiX (0.25nM) Spike-In has a value, calculates the PhiX Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - Generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, then open it in Excel.
7. Select Next Steps.
This selection triggers the Set Next Step automation. This automation sets the next step for samples to ADVANCE, advancing them to the next step in the protocol—Dilute, Denature & ExAmp (NovaSeq 6000 v2.3).
On the Assign Next Steps screen, the next step is already set to Dilute, Denature & ExAmp (NovaSeq 6000 v2.3).
8. Select Finish Step.
At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step.

Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v2.3)

In this step, pooled samples are denatured and diluted by the addition of DPX, NaOH, Tris-HCl, and RSB. Manually create working pools based on the number of lanes you want to sequence. The step input is Bulk pool and the step output is Working pool. Working pool is a variable number for how many working pools need to be created per bulk pool.

The following automations are configured on the step:

- Calculate Volumes

For Research Use Only. Not for use in diagnostic procedures.

- Set Next Step
- Validate Inputs Flowcell Type

These automations are described in the order in which they are triggered at run time.

Validate Inputs Flowcell Type Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` script. This script does the following actions:

- Checks the inputs to the step and validates that the Flowcell Type field has been set to a valid value (SP, S1, S2, or S4). The automation also checks that all inputs have the same value.
- Validates that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message state that the number of working pools does not match the number of lanes available on the flow cell.

```
bash -l -c "/opt/gls/clarity/bin/java -jar
/opt/gls/clarity/extensions/novaseq/novaseq-extensions.jar script:validate_
flowcell_for_input_pools -i {stepURI:v2} -u {username} -p {password} -l
{compoundOutputFileLuid1}"
```

Calculate Volumes Automation

Automatically triggered on entry to of the Record Details screen, this automation sets the value of the following fields, based on the Flowcell Type:

- BP Aliquot Volume (µl)
- NaOH Volume (µl)
- Tris-HCl Volume (µl)
- DPX1 Volume (µl)
- DPX2 Volume (µl)
- DPX3 Volume (µl)
- Mastermix per Lane (µl)

```
if (input.::Flowcell Type:: == ::SP::) {
output.::BP Aliquot Volume (ul):: = 18;
output.::NaOH Volume (ul):: = 4;
output.::Tris-HCl Volume (ul):: = 5;
step.::DPX1 Volume (ul):: = 126;
step.::DPX2 Volume (ul):: = 18;
step.::DPX3 Volume (ul):: = 66;
output.::Mastermix per Lane (ul):: = 63
};
```

For Research Use Only. Not for use in diagnostic procedures.

```
if (input.::Flowcell Type:: == ::S1::) {
output.::bp Aliquot Volume (µl):: = 18;
output.::NaOH Volume (µl):: = 4;
output.::Tris-HCl Volume (µl):: = 5;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 63
};
if (input.::Flowcell Type:: == ::S2::) {
output.::bp Aliquot Volume (µl):: = 22;
output.::NaOH Volume (µl):: = 5;
output.::Tris-HCl Volume (µl):: = 6;
step.::DPX1 Volume (µl):: = 126;
step.::DPX2 Volume (µl):: = 18;
step.::DPX3 Volume (µl):: = 66;
output.::Mastermix per Lane (µl):: = 77
};
if (input.::Flowcell Type:: == ::S4::) {
output.::bp Aliquot Volume (µl):: = 30;
output.::NaOH Volume (µl):: = 7;
output.::Tris-HCl Volume (µl):: = 8;
step.::DPX1 Volume (µl):: = 315;
step.::DPX2 Volume (µl):: = 45;
step.::DPX3 Volume (µl):: = 165;
output.::Mastermix per Lane (µl):: = 105
};
```

- Copies the Flowcell Type and Loading Workflow Type values from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
output.::Loading Workflow Type::= input.::Loading Workflow Type::;
```

- Uses the `NovaSeq_Xp_Working_Pool.csv` and `NovaSeq_Xp_Working_Pool2.csv` template files to generate a single CSV file containing information about the DPX volume and the volume of BP Aliquot, Mastermix, NaOH, and Tris-HCl to add per working pool. The generated file is available for download on the Step Setup screen of the following step—Load to Flowcell (NovaSeq 6000 v2.3).

Set Next Step Automation

Automatically triggered on exit of the Record Details screen, this automation:

For Research Use Only. Not for use in diagnostic procedures.

- Copies the Flowcell Type values from the step inputs to the step outputs.
- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol:

```
output.::Flowcell Type:: = input.::Flowcell Type:: ; nextStep = ::ADVANCE::
```

Master Step Fields

The following table provides field configuration details for the fields defined on Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step. These field values are set by a script and are not editable while running the step.

Table 228 Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
DPX1 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX2 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
DPX3 Volume (µl)	Numeric	Read Only	Decimal places displayed = 0

Global Fields

The following table lists the global fields that are configured to display on the Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step.

Table 229 Global Field Configuration

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Configured on Derived Sample			
BP Aliquot Volume (µl)	Numeric	Read Only	Decimal places displayed = 0
Flowcell Type	Text Dropdown	Required Field	Presets • SP • S1 • S2 • S4

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Field Constraints/Options	Preset Values/Additional Options and Drop-Down Items
Loading Workflow Type	Text Dropdown	Required Field	Presets • NovaSeq Standard • NovaSeq Xp • [Remove from workflow]
Mastermix per Lane (µl)	Numeric	Read Only	Decimal places displayed = 0
NaOH Volume (µl)	Numeric	Read Only	Decimal places displayed = 2
Tris-HCl Volume (µl)	Numeric	Read Only	Decimal places displayed = 2

User Interaction

1. On the Queue screen, add the pool to the Ice Bucket and select View Ice Bucket.
2. On the Ice Bucket screen, set the number of derivatives to create (they are placed into the flow cell lanes) and select Begin Work.
   On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type (calculation details are provided in the previous Calculate Volumes Automation section):
   - BP Aliquot Volume (µl)
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)

   The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool. Select the file to download it, then open it in Excel.
3. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, RSB, and Tris-HCl reagent lots. Select from the active lots displayed in each drop-down list.

> To make reagent lots available for selection in the Reagent Lot Tracking section, configure and activate them. Do this step on the Configuration > Consumables screen.

4. In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. (These values are set by a script and are not editable while running the step.)
5. In the Sample Details table, select the pool icon to view details on the working pool composition.
   - The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are already populated. (These values are set by a script and are not editable while running the step.)
   - The working pool number is appended to the bulk pool name. This feature helps quickly identify which working pools are derived from the same bulk pool.
6. In the Files area, select the Calculation File (*csv) file to download it. Open the file in Excel to view information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
7. Select Next Steps to trigger the Set Next Step automation.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v2.3).
8. Select Finish Step.

Step 3: Load to Flowcell (NovaSeq 6000 v2.3)

In this step, scan the flow cell barcode into Clarity LIMS, then manually place the working pools into the lanes of the flow cell that is used in the NovaSeq run. The step input is Working pool and the step output is Flow cell (output containers: S1 and S2 with 2 lanes, and S4 with 4 lanes).

The following automations are configured on this step:

- Generate Sample Sheet & Run Recipe
- Prepare Files for NovaSeq
- Validate Flowcell Barcode
- Validate Inputs and Selected Container

These automations are described in the order in which they are triggered at run time.

Validate Inputs and Selected Container Automation

Automatically triggered at the beginning of the step, this automation invokes the `validate_flowcell_for_input_pools` and `validateSelectedContainer` scripts. These scripts validate the step inputs and the container selected, as follows.

- Check that the Flowcell Type field has been set to a valid value (S1, S2, S4, or SP) and that all inputs have the same value.

- Check that the number of outputs matches the number of lanes on the selected flow cell type. If validation fails, an error message states that the number of working pools does not match the number of lanes available on the flow cell. The following table defines the number of samples allowed:

Flowcell Type	Number of Working Pools
SP	2
S1	2
S2	2
S4	4

- Check that the container type selected on entry to the Placement screen matches the value in the Flowcell Type field. If validation fails, an error message displays.

Validate Flowcell Barcode Automation

Automatically triggered on exit of the Placement screen, this automation validates the flow cell barcode scanned into Clarity LIMS, using the following logic:

```
if (input.::Flowcell Type:: == ::SP:: && !output.container.name.matches(::[A-Z0-9]{5}DR[A-Z0-9]{2}::)) {
fail(::Invalid Flowcell Barcode. Please verify and try again.::)
};
if (input.::Flowcell Type:: == ::S1:: && !output.container.name.matches(::[A-Z0-9]{5}DR[A-Z0-9]{2}::)) {
fail(::Invalid Flowcell Barcode. Please verify and try again.::)
};
if (input.::Flowcell Type:: == ::S2:: && !output.container.name.matches(::[A-Z0-9]{5}DM[A-Z0-9]{2}::)) {
fail(::Invalid Flowcell Barcode. Please verify and try again.::)
};
if (input.::Flowcell Type:: == ::S4:: && !output.container.name.matches(::[A-Z0-9]{5}DS[A-Z0-9]{2}::)) {
fail(::Invalid Flowcell Barcode. Please verify and try again.::)
};
```

Generate Sample Sheet & Run Recipe Automation

Automatically triggered when a button on the Record Details screen is selected, this automation:

- Copies the Flowcell Type from the step input to the Run Mode field (hidden):

```
step.::Run Mode:: = input.::Flowcell Type::
```

- Validates the parameters entered on the Record Details screen:
  - Experiment Name can only contain alphanumeric, dash, or underscore characters. Spaces are not permitted.
  - When Workflow Type is No Index, Index Read 1 must be zero. For any other Workflow Type, Index Read 1 must be greater than zero.

```
if(!step.::Experiment Name::.matches(::[a-zA-Z0-9-_]+::)) {
fail(::Experiment Name contains prohibited characters. Allowed characters are:
a-z, A-Z, 0-9, -, and _::)
};
if(step.::Workflow Type::== ::No Index::) {
if(step.::Index Read 1::!= 0) {
fail(::Index Read 1 must be 0 if the Workflow Type is No Index.::)
}
} else{
if(step.::Index Read 1::== 0) {
fail(::Index Read 1 must be greater than 0 if the Workflow Type is ::+
step.::Workflow Type::+ ::.::)
}
};
```

  - When Paired End is True, Index Read 1 and Index Read 2 must be greater than zero.
  - When Paired End = False, Index Read 2 must be zero. Reverse Complement Workflow must be false. UMI - Read 2 Length and UMI - Read 2 Start from Cycle must not have a value.

```
if (step.::Paired End::.toBoolean()) {if (step.::Read 1 Cycles:: == 0 ||
step.::Read 2 Cycles:: == 0) {fail(::Read 1 Cycles and Read 2 Cycles must be
greater than 0 if Paired End is True.::);}} else {if (step.::Read 2 Cycles:: !=
0) {fail(::Read 2 Cycles must be 0 if Paired End is False.::);}
if (step.hasValue(::UMI - Read 2 Length::) || step.hasValue(::UMI - Read 2 Start
From Cycle::)) {fail(::UMI - Read 2 Length and UMI - Read 2 Start From Cycle
cannot be defined if Paired End is False.::);}}
```

  - Validates allowed read cycles to be not greater than 151 if the Flowcell Type is not SP.

```
if (input.::Flowcell Type:: != ::SP:: && step.::Read 1 Cycles:: > 151) {
fail(::Read 1 Cycles must not be larger than 151 if it is not SPrime
Flowcell.::);
}
if (input.::Flowcell Type:: != ::SP:: && step.::Read 2 Cycles:: > 151) {
fail(::Read 2 Cycles must not be larger than 151 if it is not SPrime
Flowcell.::);
}
```

- Validates allowed value for UMI - Read 1 Length, UMI - Read 2 Length, UMI - Read 1 From Cycle, UMI - Read 2 From Cycle.

```
if (step.hasValue(::UMI - Read 1 Length::) && !step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 1
Length is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 1
Start From Cycle::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 1 Start From
Cycle is greater than 0.::);
}
if (step.hasValue(::UMI - Read 2 Length::) && !step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Start From Cycle must be greater than 0 if UMI - Read 2
Length is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 2 Length::) && step.hasValue(::UMI - Read 2
Start From Cycle::)) {
fail(::UMI - Read 2 Length must be greater than 0 if UMI - Read 2 Start From
Cycle is greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Length::) && step.hasValue(::UMI - Read 2
Length::)) {
fail(::UMI - Read 1 Length must be greater than 0 if UMI - Read 2 Length is
greater than 0.::);
}
if (!step.hasValue(::UMI - Read 1 Start From Cycle::) && step.hasValue(::UMI -
Read 2 Start From Cycle::)) {
fail(::UMI - Read 1 Start From Cycle must be greater than 0 if UMI - Read 2
Start From Cycle is greater than 0.::);
}
```

- Copies the Flowcell Type value from the step inputs to the step outputs:

```
output.::Flowcell Type::= input.::Flowcell Type::;
```

- Sets the next step for samples to ADVANCE, advancing them to the next step in the protocol—AUTOMATED - Run (NovaSeq 6000) v2.3.

```
nextStep = ::ADVANCE::
```

- Generates the sample sheet and the run recipe file and attaches them to the step. For details on how the files are generated, and their contents, refer to *Sample Sheet and Run Recipe File Generation* on page 969.

Prepare Files for NovaSeq

Automatically triggered on exit of the Record Details screen, this automation invokes the `copy_attachments_to_network_folder` script, which is included in the `novaseq-remote-extensions.jar` file. This script places the generated sample sheet and run recipe (*json file) into the appropriate folder on the NAS, where the instrument uses them to start the run.

For more information, refer to *Sample Sheet and Run Recipe File Generation* on page 969.

Master Step Fields

The following table provides field configuration details for the fields defined on the Load to Flowcell (NovaSeq 6000 v2.3) step.

Table 230 Load to Flowcell (NovaSeq 6000 v2.3) Master Step Field Configuration

Field Name	Field Type	Options	Additional Options and Drop-Down Items
BaseSpace Sequence Hub Configuration	Text Dropdown	Required Field	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Experiment Name	Text	Required Field	
Index Read 1	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Index Read 2	Numeric Dropdown	Required Field Custom Entries	Range = 0–20 Decimal places displayed = 0 Presets • 0 • 6 • 8
Library Tube Barcode	Text	Required Field	

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Paired End	Text Dropdown	Required Field	Presets • True • False
Read 1 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 1–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Read 2 Cycles	Numeric Dropdown	Required Field Custom Entries	Range = 0–251 Decimal places displayed = 0 Presets • 251* • 151 • 101 • 51 *The value of 251 is only supported for SP flow cell type. For all other flow cell types, the maximum value is 151.
Reverse Complement Workflow	Toggle Switch	Required Field	Default • Yes

For Research Use Only. Not for use in diagnostic procedures.

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Run Mode (not displayed in user interface)	Text Dropdown	Read Only	Presets • SP • S1 • S2 • S4
Sample Sheet Path	Text	Read Only	
UMI - Read 1 Length	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 1 Start From Cycle	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 2 Length	Numeric		Range = 1 Decimal places displayed = 0
UMI - Read 2 Start From Cycle	Numeric		Range = 1 Decimal places displayed = 0
Use Custom Index Read 1 Primer	Toggle Switch		Default • No
Use Custom Read 1 Primer	Toggle Switch		Default • No
Use Custom Read 2 Primer	Toggle Switch		Default • No
Workflow	Text	Read Only	Default • GenerateFASTQ
Workflow Type	Text Dropdown	Required Field	Presets • No Index • Single Index • Dual Index

Global Fields

The following table lists the global fields that are configured to display on the Load to Flowcell (NovaSeq 6000 v2.3) step.

Field Name	Field Type	Options	Additional Options and Drop-Down Items
Configured on Derived Sample			
Flowcell Type	Text Dropdown	Required Field	Presets • S1 • S2 • S4 • SP

User Interaction

1. On the Ice Bucket screen, select the appropriate flow cell type from the Destination Container drop-down list in the Container Options panel.
2. Select Begin Work.
3. On the Placement screen, move the pools as follows.
   a. Drag the pools from the left of the screen over into the Placed Samples area on the right.
   b. Scan or type the barcode of the flow cell into the flow cell field.
   c. Select Record Details.

   On exit of the Placement screen, the Validate Flowcell Barcode automation validates the container barcode (described previously). The fields displayed on the Record Details screen are used to generate the sample sheet and run recipe files. Some of these fields are autopopulated and some must be completed manually.

Table 231 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v2.3) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. Spaces are not permitted.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Workflow Type	Presets • No Index • Single Index • Dual Index
Index Read 1	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • Type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 1 and 251 for the SP flow cell type or between 1 and 151 for all other types
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • Type a value between 0 and 251 for the SP flow cell type or between 0 and 151 for all other types
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.

Field	Value
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Sample Sheet Path	Automatically populated after the sample sheet has been generated.
Library Tube Barcode	Scan the library tube barcode.

4. On the Record Details screen, select Generate Sample Sheet & Run Recipe.
   This selection triggers the automation script, which does the following actions:
   - Generates the sample sheet and JSON files and attaches them to the placeholders in the Files area of the Record Details screen.
   - Populates the Sample Sheet Path field with the path to the sample sheet file.
5. Select Next Steps to trigger the Prepare Files for NovaSeq automation, which copies the sample sheet and run recipe files to the location specified during installation.
   On the Assign Next Steps screen, the Next Step for all samples is prepopulated with Mark protocol as complete.
6. Select Finish Step.
   In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step.

At this point in the workflow, the user interaction ends. The integration automatically starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step and data from the run is parsed back into Clarity LIMS.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)

This final protocol contains one fully automated step, AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3).

Step 1: AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)

Step input: Library tube from the NovaSeq Standard protocol or flow cell from the NovaSeq Xp protocol.

Step output: Result file and measurement.

> Do not add samples to the Ice Bucket or start the step manually. This is a fully automated step. The sequencing service does not update samples correctly if they have been manually started.

In this step, pooled samples are sequenced on the NovaSeq instrument. The run data network folder is monitored by the sequencing service and automation worker to determine when the sequencing run begins and ends.

1. When a run is initiated on the NovaSeq instrument, the NovaSeq Control Software (NVCS) looks for the sample sheet and run recipe (*.json file) on the shared network drive.
   - The NVCS copies the sample sheet to the run directory.
   - The NVCS uses the run recipe to start the sequencing run.
2. When the run starts:
   - The instrument software creates a new run folder (named < libraryID >) on the shared network drive and copies the following files into that folder:
     - RunParameters.xml
     - RunInfo.xml
     - LIMS/ <libraryID>.json file (run recipe)
   - The Real-Time Analysis v3 (RTA3) software creates the InterOp folder.
3. The sequencing service detects the presence of the RunParameters, RunInfo, and JSON files and starts the AUTOMATED- NovaSeq Run (NovaSeq 6000 v2.3) step in Clarity LIMS.
4. As the run progresses, the InterOp data files are filled in.
5. At the end of the run, the NovaSeq:
   - Copies the run data files to the InterOp folder.
   - Creates the `CopyComplete.txt` file in the run folder. This step indicates to the sequencing service that the run has completed and the data files are ready.
6. The sequencing service triggers the Read InterOp Metrics automation. This automation reads the files, records the parsed metrics into Clarity LIMS, and finally completes the step in Clarity LIMS.

Parse Run Parameters and Generate Link to Run Folder Automation

Automatically triggered on entry to the Record Details screen, this automation does the following actions:

- Parses the `RunParameters.xml` file attached on the Step Setup screen.
- Populates the master and global step fields with extracted values.

- If there is an instrument in Clarity LIMS that matches the instrument name in the file (InstrumentName field), the script associates this instrument with the run.
- Generates and attaches a link to the run folder using the run output folder parsed from `RunParameters.xml`.

The following rules and constraints are present:

- If there is no InstrumentName value in the file, the script continues, but it logs a warning.
- If there is an InstrumentName value in the file and multiple instruments with the same name exist in Clarity LIMS, the script fails and logs an error.
- If the `RunParameters.xml` file is not attached to the step during step setup, the script fails.
- Every `RunParameters.xml` field that has an equivalent step UDF/custom field in Clarity LIMS is required—except for InstrumentName. If a field is not present in the `RunParameters.xml` file, Clarity LIMS logs an error to this effect.

Master Step Fields

The fields defined on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step are listed in the Clarity LIMS Configuration area (Custom Fields > Master Step Fields tab).

The following table shows how the parsed `RunParameters.xml` fields map to step fields configured on the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step in Clarity LIMS.

Table 232 Fields Parsed by parse_novaseq_run_parameters script

RunParameters.xml Field	Field Name
FlowCellSerialBarcode	Flow Cell ID
FlowCellPartNumber	Flow Cell Part Number
FlowCellLotNumber	Flow Cell Lot Number
FlowCellExpirationdate	Flow Cell Expiration Date
FlowCellMode	Flow Cell Mode
RunId	Run ID
ClusterSerialBarcode	PE Serial Barcode
ClusterPartNumber	PE Part Number
ClusterLotNumber	PE Lot Number
ClusterExpirationdate	PE Expiration Date
ClusterCycleKit	PE Cycle Kit
SbsSerialBarcode	SBS Serial Barcode

RunParameters.xml Field	Field Name
SbsPartNumber	SBS Part Number
SbsLotNumber	SBS Lot Number
SbsExpirationdate	SBS Expiration Date
SbsCycleKit	SBS Cycle Kit
BufferSerialBarcode	Buffer Serial Barcode
BufferPartNumber	Buffer Part Number
BufferLotNumber	Buffer Lot Number
BufferExpirationdate	Buffer Expiration
OutputRunFolder	Output Folder
WorkflowType	Loading Workflow Type

Read InterOp Metrics Automation

Automatically triggered when the sequencing service detects the `CopyComplete.txt` file has been created, this automation parses the InterOp data generated by the run.

- Read summary metrics are recorded on the library pool. These values are aggregated across all lanes. Some values—for example Yield PF (Gb)—are summed, while others are averaged.
- Per lane metrics are recorded on the measurement outputs.

The `read_interop_metrics` script loads data from the InterOp files and records summary metrics into derived sample UDFs/custom fields in Clarity LIMS. If any field is not configured or cannot be written to, the script fails.

Global Fields

The global fields that are configured to support the parsing of key metrics back into Clarity LIMS are as follows.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2

- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R
- % Error Rate R1
- % Error Rate R2

Set Next Steps Automation

Automatically triggered on exit of the Record Details screen, the following automation sets the next step to ADVANCE and the samples complete the protocol:

```
nextStep = ::ADVANCE::
```

Update Lane Number Automation

Automatically triggered on exit of the Step Setup screen, this automation updates the lane number so that Read InterOp Metrics automation script can populate lane metric to the correct lane.

> Do not disable Update Lane Number automation as it causes run metric parsing to work improperly.

Components Installed

The following sections describe the various components that are installed by default as part of this integration. These components include files, database properties, reagent categories/label groups, reagent kits, and containers. Information on installed workflows, protocols, steps, and automation points is provided in the previous *Workflows, Protocols, and Steps* section.

The Illumina NovaSeq 6000 Integration v2.5 Package is distributed as two RPM packages:

- BaseSpaceLIMS-novaseq-extensions
- BaseSpaceLIMS-novaseq-sequencing-service

The RPM packages install the components listed in the following table.

The NovaSeq 6000 Integration requires installation of NGS Extensions Package v5.23 or later.

- If the NGS Extensions Package is not already installed, or if a version earlier than v5.23 is installed, the latest version is installed by default with the NovaSeq integration. For details, refer to *NovaSeq 6000 Integration v2.5 Release Notes* on page 1002.
- If NGS Extensions Package v5.23 is already installed, upgrade is not forced or required.
- Secret Util Package is required for the NGS Extensions Package v5.23.
- If the Secret Util Package is not already installed, then Secret Util package is installed along with the installation of NGS Extension Package v5.23.
- If the Secret Util Package is already installed, upgrade is not forced or required.

Table 233 Illumina NovaSeq 6000 Integration v2.5 RPM Components

Files Installed	Location and Description
`configure_extensions_novaseq.sh`	`/opt/gls/clarity/config/` Script that imports Clarity LIMS configuration into the application database and updates property values.
`novaseq-extensions.jar`	`/opt/gls/clarity/extensions/novaseq` Jar file containing API-based Clarity LIMS extensions used throughout the protocols.
`novaseq-sequencing.jar`	`/opt/gls/clarity/extensions/novaseq/SequencingService` Sequencing service jar file that captures the run results.
`novaseq-remote-extensions.jar`	`/opt/gls/clarity/extensions/novaseq` Jar file containing scripts that require access to the run folders on the NAS.
InterOp libraries	`/opt/gls/clarity/extensions/novaseq/lib` Illumina shared library for parsing InterOp data files.

`NovaSeq_Standard_Bulk_Pool1.csv`
`NovaSeq_Standard_Bulk_Pool2.csv`
`NovaSeq_Standard_Bulk_Pool3.csv`
`NovaSeq_Xp_Bulk_Pool.csv`
`NovaSeq_Xp_Bulk_Pool2.csv`
`NovaSeq_Xp_Working_Pool.csv`
`NovaSeq_Xp_Working_Pool2.csv`
	`/opt/gls/clarity/extensions/novaseq/Templates`
	Template files used for file generation throughout the protocols.

Database Properties

The following table lists the database properties installed with the Illumina NovaSeq 6000 Integration v2.5 Package.

Table 234 Database Properties Installed

Property	Description
novaseq.runSetupFolder	The directory where the run recipe files are written.
novaseq.sampleSheetPathPrefixSearch.SUFFIX	The directory where the instrument control software or analysis software looks for sample sheets, typically a Windows path to a network drive.
novaseq.sampleSheetPathPrefixReplace.SUFFIX	The directory where the sample sheets are written.
novaseq.sampleSheetPathPrefixSearchReplaceSuffixes[1]	Search and replace entries for transforming Windows to Linux network paths. This property must be set to the single SUFFIX used in the two previous properties.
novaseq.seqservice.netPathPrefixSearch.SUFFIX	The search prefix used to map the OutputRunFolder field in `RunParameters.xml` to the corresponding Linux directory.
novaseq.seqservice.netPathPrefixReplace.SUFFIX	The directory where the sequencing service looks for run folders.
novaseq.seqservice.netPathPrefixSearchReplaceSuffixes[1]	Search and replace entries for transforming Windows to Linux network paths. This property must be set to the single SUFFIX used in the two properties above.

[1]This version of the integration only supports a single active search-replace pair of each type:sampleSheetPathPrefixSearchReplaceSuffixes and netPathPrefixSearchReplaceSuffixesmust each contain a single number, rather than a comma-separated list of numbers.

For Research Use Only. Not for use in diagnostic procedures.

Label Groups, Reagent Kits, and Containers

The NovaSeq 6000 Integration v2.5 Package installs the following label groups, reagent kits, and container types.

Label Groups

- TruSeq HT Adapters v2 (D7-D5)

Reagent Kits

- DPX1
- DPX2
- DPX3
- Resuspension Buffer (RSB)
- NaOH
- Tris-HCl

Container Types

- Library Tube
- S1
- S2
- S4
- SP

Instrument Integration

The following are instructions for configuring the NovaSeq instrument for the Clarity LIMS integration:

1. Launch NovaSeq Control Software.
2. On the home screen, select the menu (top left) and select Settings.
3. Select File-Based and enter the network folder location that NovaSeq Control Software retrieves the JSON recipe from.
4. Enter the network output folder location.
5. Select Save.

For more information, refer to the *NovaSeq 6000 Sequencing System Guide* at support.illumina.com.

Routing Script Requirements

The requirements for the routing script functionality are as follows.

- On the steps that use the routing script—Define Run Format (NovaSeq 6000 v2.3) and Dilute and Denature (NovaSeq 6000 v2.3)—the Next Step for all samples must be set to Remove from workflow. This value is set by a script. Do not change this value in the Assign Next Steps screen.

- In the protocol configuration screen, the following setting is required and must not be changed.
  - In the Next Steps section for the last step in the protocol, the method of assigning the next step must be set to Automatic.

Sample Sheet and Run Recipe File Generation

Sample sheet and run recipe file generation occurs on the step before the run—Dilute and Denature (NovaSeq 6000 v2.3) in the NovaSeq Standard protocol or Load to Flowcell (NovaSeq 6000 v2.3) in the NovaSeq Xp protocol. This step is where samples are placed on the library tube or flow cell that is loaded in the NovaSeq instrument.

In the default configuration, the Generate Sample Sheet & Run Recipe automation generates the following:

- One CSV format sample sheet file for use bcl2fastq v2.20 downstream analysis
- One JSON format run recipe file

The Prepare Files for NovaSeq automation places the generated files on the NAS where the instrument uses them to start the run.

How It Works

- The Prepare Files for NovaSeq automation command line invokes the `copy_attachments_to_network_folder` script `in novaseq-remote-extensions.jar`. The script can be used on a remote AI node/automation worker, in case the Clarity LIMS server does not have direct access to the NAS.
- The output folder for the run recipe file is found in the `novaseq.runSetupFolder` property.
- The output folder for the sample sheet is determined by using the `novaseq.sampleSheetPathPrefixReplace.<suffix>` property (not a comma-separated list).

Sample Sheet Contents

The contents of the sample sheet are controlled by the following fields configured on the Dilute and Denature (NovaSeq 6000 v2.3) and Load to Flowcell (NovaSeq 6000 v2.3) steps:

- Experiment Name
- Read 1 Cycles
- Read 2 Cycles
- Workflow
- Reverse Complement Workflow
- Read1UMILength
- Read2UMILength

For Research Use Only. Not for use in diagnostic procedures.

- Read1StartFromCycle
- Read2StartFromCycle

Refer to the *Bcl2fastq2 Sample Sheet Generation* section of the *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542 document for detailed information on the following:

- Sample sheet generation script parameters and usage
- Sample sheet data and configuration options
- Enabling unique FASTQ file names per sequencing run

Run Recipe Contents

The contents of the run recipe are controlled by the following fields. These fields are configured on the Dilute and Denature (NovaSeq 6000 v2.3) and Load to Flowcell (NovaSeq 6000 v2.3) steps.

- Experiment Name
- Run Mode
- Workflow Type
- Sample Loading Type (populated based on Workflow field)
- Paired End
- Read 1
- Read 2
- Index Read 1
- Index Read 2
- Sample Sheet Path
- BaseSpace Configuration
- Use Custom Read 1 Primer
- Use Custom Read 2 Primer
- Use Custom Index Read 1 Primer

The following fields are also included in the run recipe:

- Library Tube Barcode (librarytube_ID in JSON file)
  - NovaSeq Standard workflow—Library tube barcode is derived from the container name entered or scanned on the Placement screen.
  - NovaSeq Xp workflow—Library tube barcode is derived from the Library Tube Barcode field in the Load To Flowcell (NovaSeq 6000 v2.3) step.
- Flowcell Barcode (flowcell_ID in JSON file)
  - NovaSeq Standard workflow—Library tube barcode is not output to JSON recipe file.

  - NovaSeq Xp workflow—Flow cell barcode is derived from the container name entered or scanned on the Placement screen.
- Rehyb—preset to False.
- Output Folder (output_folder in JSON file)—Derived from the system property novaseq.seqservice.netPathPrefixSearch.
- Attachment—Derived from the system property novaseq.sampleSheetPathPrefixSearch with the name of the sample sheet added to the end of the path.
- Use BaseSpace (use_basespace in JSON file)—Set to False if the BaseSpace Sequence Hub Configuration step field value is Not Used, and true otherwise.

Rules and Constraints

- The sample sheet and run recipe files are mandatory inputs for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step. For the automated run to start successfully, select the Generate Sample Sheet & Run Recipe button to generate these files.
- The output folders must exist on the system where the script runs (can be a remote AI node/automation worker).
- The output folders must be writable by the glsai user.

Container Types

The integration supports the following container types:

- Library tube with barcode provided in the following format:
  - [A-Z]{2}[0-9]{7}-[A-Z]{3}
  - Example—NV1234567-LIB
- Flow cell with barcode provided in one of the following formats:
  - For SP and S1—[A-Z0-9]{5}DR[A-Z0-9]{2}
  - For S2—[A-Z0-9]{5}DM[A-Z0-9]{2}
  - For S4—[A-Z0-9]{5}DS[A-Z0-9]{2}
  - Example S2 flow cell barcode—H1234DMXX

Rules and Constraints

- The workflow configuration contains several validation checks. To make sure that the calculations work properly, it is important that you do not disable any of this validation logic. The validation checks the following information:
  - Which samples, and how many, can enter each step together.
  - Which samples, and how many, can be pooled together.
- Reagent labels (indexes) must be unique.

- The library tube ID must be unique. There should not be multiple library tube containers in the system with the same name.
- Only controls are permitted as unindexed samples. All other unindexed samples and pools are not permitted.
- Refer to the *Bcl2fastq2 Sample Sheet Generation* section of the *Illumina Instrument Sample Sheets (NGS v5.17 & later)* on page 2542 document for detailed information on the following:
  - Sample sheet generation script parameters and usage
  - Sample sheet data and configuration options
  - Enabling unique FASTQ file names per sequencing run
- Do not manually start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step. This step is fully automated. If the samples have been manually started, the sequencing service does not update them correctly.
- The output folder must be readable by the Clarity LIMS glsjboss account on the server.

NovaSeq 6000 Integration v2.5 Validation and Troubleshooting

This guide explains how to validate the installation of the Illumina NovaSeq 6000 Integration Package v2.5. The validation process involves the following actions:

- Running samples through the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow. The workflow contains a single-step protocol that models the library prep required to produce normalized libraries. At the end of the step, the normalized libraries are automatically advanced to the NovaSeq 6000 v2.3 workflow.
- Running normalized libraries through the NovaSeq 6000 v2.3 workflow. This process validates the following details:
  - Successful routing of samples from the Run Format (NovaSeq 6000 v2.3) step to the NovaSeq Standard (NovaSeq 6000 v2.3) or NovaSeq Xp (NovaSeq 6000 v2.3) step.
  - Automated generation of a sample sheet for use with bcl2fastq2 v2.20 analysis software.
  - Automated generation of a run recipe file (JSON file) with the library tube or flow cell barcode as the name (eg, NV1234567-LIB.json or H1234DRXX.json). This file is automatically uploaded to the sequencing instrument and used to set up and initiate the run.
  - Automated tracking of the NovaSeq sequencing run and parsing of run statistics (per run per lane) into Clarity LIMS.

Before executing the validation steps, make sure that you have installed the Illumina NovaSeq 6000 Integration Package v2.5 and have imported the default Clarity LIMS configuration.

Activate Workflow, Create Project, Add and Assign Samples

The following steps set up Clarity LIMS in preparation for running samples through the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) and NovaSeq 6000 v2.3 workflows.

1. In the Clarity LIMS Configuration area, activate the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) and NovaSeq 6000 v2.3 workflows.
2. On the Projects and Samples screen, create a project and add samples to it.
3. Assign the samples to the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow.

Library Prep Protocol: NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)

This single-step protocol models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v2.3 workflow.

Run NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)

1. In Lab View, locate the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) protocol. The samples are queued for the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Placement screen, scan or enter the barcode of the destination container into the Container field of the Placed Samples area.
   a. Select the samples from the Samples to be Placed area on the left, then drag them over to the container wells on the right.
   b. Select Add Labels.
5. On the Add Labels screen, select labels from the Labels to Add list and drag them to the container on the right to assign them to placed samples.
   The TruSeq HT Adapters v2 (D7-D5) label group is the only label group configured in the out-of-the-box integration and is the default in this step.
   a. Select Record Details.
6. On the Record Details screen in the Sample Details table, enter values for Normalized Molarity. Type values individually or use the copy/paste functionality as follows.
   a. Select the Copy button to copy the sample information from Clarity LIMS to the clipboard.
   b. Open a blank Excel document and paste the contents of the clipboard into the spreadsheet.
   c. In the spreadsheet, enter the Normalized Molarity values. Select the entire spreadsheet, including the headers (Ctrl + A), and copy (Ctrl + C) the information to the clipboard.
   d. In Clarity LIMS, select the Paste button. Paste the contents of the clipboard (Ctrl + V) into the Update Table window, then select Update to paste into the Sample Details table.

   The Sequencer Type field indicates the instrument to be used for the sequencing run. In this integration, the value of this field is set to NovaSeq automatically.

7. Select Next Steps.
   This selection triggers the Next Steps automation, which sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
8. On the Assign Next Steps screen in the Samples table, the Next Step for all samples is prepopulated with Remove from workflow.

   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.

9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered. This automation assigns samples to the first step of the NovaSeq 6000 v2.3 workflow—Define Run Format (NovaSeq 6000 v2.3). This is the only step in Protocol 1: Run Format (NovaSeq 6000 v2.3).

Protocol 1: Run Format (NovaSeq 6000 v2.3)

This protocol includes the Define Run Format (NovaSeq 6000 v2.3) step. The step allows for the assignment of per sample values for Loading Workflow Type, Normalized Molarity, Flowcell Type, and Final Loading Concentration (pM). At the end of the step, samples are routed to the NovaSeq Standard or NovaSeq Xp protocol, according to the selected Loading Workflow Type.

Step 1: Run Define Run Format (NovaSeq 6000 v2.3)

1. In Lab View, locate the Run Format (NovaSeq 6000 v2.3) protocol. The samples are queued for the Define Run Format (NovaSeq 6000 v2.3) step.
2. Add the samples to the Ice Bucket and select View Ice Bucket.
3. On the Ice Bucket screen, select Begin Work.
4. On the Record Details screen, specify the Sample Details.
   - Loading Workflow Type—Select NovaSeq Standard or NovaSeq Xp from the drop-down list.
   - Normalized Molarity—Enter values or use values copied from the previous step.
5. Populate the following fields:

Values can vary across samples.

   - Flowcell Type—Select SP, S1, S2, or S4.
   - Final Loading Concentration (pM)—Select from the two preset options—225 (for PCR-free workflows) or 400 (for Nano workflows)—or enter a different value.
6. Select Next Steps to trigger the Set Next Steps automation, which does the following actions:
   - Sets the value of the next step (for all samples) to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
   - Calculates the Minimum Molarity.

- Checks Normalized Molarity value. For samples with no Normalized Molarity value (eg, an empty value, not including 0), the automation generates an error message stating that the field cannot be empty.
- Compares the Normalized Molarity value of each sample with the Minimum Molarity value.

7. On the Assign Next Steps screen, review the Sample Details table and make sure that the Next Step for all samples is prepopulated with Remove from workflow.
   Next Step must be set to Remove from workflow, regardless of the Loading Workflow Type.

   If the Next Step value is not set to Remove from workflow, the routing script automation cannot advance to the next step.

8. Review the Warning field entries for the samples. If the field indicates that the Normalized Molarity is too low, continue with one of the following options:
   - Return to the Record Details screen and adjust the Normalized Molarity value so that it equals or exceeds the Minimum Molarity value. Set the Loading Workflow Type to NovaSeq Standard or NovaSeq Xp, as applicable.
   - Alternatively, complete the protocol without correcting the Normalized Molarity value. In this case, the samples in question are removed from the Clarity LIMS workflow.
9. Select Finish Step.
   The Routing Script automation is triggered if:
   - Samples with a Loading Workflow Type of Remove from workflow (ie, where Normalized Molarity value is lower than the Minimum Molarity) are removed from the Clarity LIMS workflow.
   - Samples with a Loading Workflow Type of NovaSeq Standard are routed to the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step. This step is the first of two steps in Protocol 2: NovaSeq Standard (NovaSeq 6000 v2.3).
   - Samples with a Loading Workflow Type of NovaSeq Xp are routed to the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step. This step is the first of three steps in Protocol 3: NovaSeq Xp (NovaSeq 6000 v2.3).

Protocol 2: NovaSeq Standard (NovaSeq 6000 v2.3)

In this protocol, samples are pooled and added to the library tube in preparation for the NovaSeq run. The protocol contains two steps:

1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)
2. Dilute and Denature (NovaSeq 6000 v2.3)

Step 1: Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v2.3) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) step.

2. On the Queue screen, add samples of the same flow cell type to the Ice Bucket and select Begin Work.
3. On the Pooling screen, create a pool by dragging samples into the Pool Creator. Only one pool must be created.
   a. Type a name for the pool or accept the default name (Pool #1).
   b. Select Record Details.
4. On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks the following information:
   - All samples in the pool have been assigned the same Flowcell Type.
   - Only one pool has been created.
5. On the Record Details screen in the Step Details area, complete the fields as follows.
   a. Enter the value for the Number of Flowcells to Sequence field.
   This value is used in volume calculations to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   b. Enter the value for the Minimum Per Sample Volume (µl) field.
   The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl), but the value can be edited if necessary.
   c. If necessary, enter the value for the % PhiX (2.5 nM) Spike-In field.
   The value in this field is used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

   Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
   - If the smallest Per Sample Volume (µl) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (µl) field.
   - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.
6. In the Sample Details table, select the pool icon to view details on the pool composition.
7. Select Calculate Volumes to trigger the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.

- Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
- Populates the Volume of Pool to Denature (µl), NaOH Volume (µl) and Tris-HCl Volume (µl) columns of the Sample Details table. (Values are set by a script and are not editable.)
- The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the pool and the individual samples it contains. Select the file to download it, then open it in Excel.

8. Select Next Steps to trigger the Set Next Steps automation.
   This automation sets the next step for samples to ADVANCE, advancing them to the Dilute and Denature (NovaSeq 6000 v2.3) step in the protocol.
9. Select Finish Step.

At the end of this step, the pool of samples automatically advances to the Dilute and Denature (NovaSeq 6000 v2.3) step.

Step 2: Dilute and Denature (NovaSeq 6000 v2.3)

1. In Lab View, locate the NovaSeq Standard (NovaSeq 6000 v2.3) protocol. The pool of samples is queued for the Dilute and Denature (NovaSeq 6000 v2.3) step.
2. Add the samples to the Ice Bucket and select Begin Work.
   At the beginning of the step, the Validate Single Input automation is triggered. This automation checks that there is only one container input to the step.
3. On the Placement screen, drag the pool into the library tube in the Placed Samples area.
   a. Scan or type the barcode of the library tube into the Library Tube field.
   b. Select Record Details.
   On exit of the Placement screen, the Validate Library Tube Barcode automation checks that the library tube barcode conforms to the barcode mask [A-Z]{2}[0-9]{7}-[A-Z]{3}. If not, an error message displays.
4. On the Record Details screen, the Reagent Lot Tracking section tracks the NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. To add and activate reagent lots, complete the following steps:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select the NaOH reagent kit and select New Lot.
   d. Set the Status of Reagent Lot switch to Active.
   e. Enter the lot details.
   f. Select Save.
   g. Repeat this process to add and activate the Resuspension Buffer and Tris-HCl reagent lots.
   h. Close this browser tab and return to your original working tab. Refresh the page.

For Research Use Only. Not for use in diagnostic procedures.

5. In the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list. The fields displayed in the Step Details section are used to generate the sample sheet and run recipe files. Some of these fields are autopopulated and some must be completed manually. Refer to the following table for details.

Table 235 Fields Displayed on Record Details Screen of Dilute and Denature (NovaSeq 6000 v2.3) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False

For Research Use Only. Not for use in diagnostic procedures.

Field	Value
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • type a value between 1 and 251 for the SP flow cell type or between 1 and 151 for all other types
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • type a value between 0 and 251 for the SP flow cell type or between 0 and 151 for all other types
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Sample Sheet Path	Automatically populated after the sample sheet has been generated.

6. On the Record Details screen, select Generate Sample Sheet & Run Recipe. This selection triggers the automation script: The sample sheet and JSON files are generated and attached to the placeholders in the Files area of the Record Details screen.
   The Sample Sheet Path field is populated with the path to the sample sheet file.

For Research Use Only. Not for use in diagnostic procedures.

7. Select Next Steps. This selection triggers the Prepare Files for NovaSeq automation, which does the following:
   - Copies the sample sheet and run recipe files to the location specified during installation. The NovaSeq instrument software uses these files to set up the run.
   - Sets the value of the next step to Remove from workflow. The Routing Script automation expects this value and requires it to advance samples to the next step successfully.
8. On the Assign Next Steps screen, the Next Step for samples is prepopulated with Remove from workflow.
   Do not change this value. If Next Step is not set to Remove from workflow, the routing script is not able to route samples correctly.
9. Select Finish Step.
   On exit from the step, the Routing Script automation is triggered and samples are routed to Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3).
   In Lab View, the pool of samples is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step.

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step. The integration does this action automatically.

Protocol 3: NovaSeq Xp (NovaSeq 6000 v2.3)

In this protocol, samples are pooled and added to lanes on the NovaSeq flow cell. The flow cell type is determined by the option selected in the Define Run Format (NovaSeq 6000 v2.3) step.

The protocol contains three steps:

1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)
2. Dilute, Denature & ExAmp (NovaSeq 6000 v2.3)
3. Load to Flowcell (NovaSeq 6000 v2.3)

Step 1: Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v2.3) protocol. The samples are queued for the Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) step.
2. On the Queue screen, add samples of the same Flowcell Type to the Ice Bucket and select Begin Work.
3. On the Pooling screen, create a pool by dragging samples into the Pool Creator. Only one pool must be created.
   a. Type a name for the pool or accept the default name Pool #1.
   b. Select Record Details.
   On exit from the Pooling screen, the Validate Inputs Flowcell Type and Single Pool is triggered. The automation checks the following details:

For Research Use Only. Not for use in diagnostic procedures.

- All samples in the pool have been assigned the same Flowcell Type.
- Only one pool has been created.

4. On the Record Details screen in the Step Details area, complete the fields as follows.
   a. Enter the value for the Number of Lanes to Sequence field.
   This value is used in volume calculations to make sure that the volumes are sufficient for the number of times the pool is sequenced.
   b. Enter the value for the Minimum Per Sample Volume (µl) field.
   The value in this field is used to calculate how much of each sample is included in the pool. The field is prepopulated with the configured default value (5 µl), but the value can be edited if necessary.
   c. If necessary, enter the value for the % PhiX (0.25 nM) Spike-In field.
   The value in this field is used to calculate the volume of PhiX v3 control to be included in the pool for the given percentage of spike-in. The field is optional and can be edited.

   Assuming the default Minimum Per Sample Volume (µl) value of 5, for a given batch:
   - If the smallest Per Sample Volume (µl) value is less than 5, the LIMS automatically assigns a value of 5 to the sample's Adjusted Per Sample Volume (µl) field.
   - Clarity LIMS then adjusts the Adjusted Per Sample Volume (µl) field value for all other samples in the batch, based on the ratio used to increase the lowest value to 5.

5. In the Sample Details table, select the pool icon to view details on the pool composition.
6. Select Calculate Volumes to trigger the Calculate Volumes automation, which performs volume calculations based on the selected Flowcell Type:
   - Calculates Bulk Pool Volume (µl) value.
   - Calculates the Per Sample Volume (µl) value to be added to the pool.
   - Calculates PhiX Volume (µl) value if % PhiX (2.5 nM) Spike-In has value.
   - Calculates the Total Sample Volume (µl) value.
   - If the Total Sample Volume is less than the Bulk Pool Volume, calculates the RSB Volume (µl) value.
   - Populates the Flowcell Type and Loading Workflow Type columns of the Sample Details table.
   - The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains volume information about the samples and RSB buffer to add to the pool. Select the file to download it, then open it in Excel.
7. Select Next Steps to trigger the Set Next Steps automation.
   This automation sets the next step for samples to ADVANCE, advancing them to the Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step in the protocol.
8. Select Finish Step.

For Research Use Only. Not for use in diagnostic procedures.

At the end of this step, the pool of samples automatically advances to the Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step.

Step 2: Dilute, Denature & ExAmp (NovaSeq 6000 v2.3)

1. In Lab View, locate the NovaSeq Xp (NovaSeq 6000 v2.3) protocol. The pool of samples is queued for the Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) step. Add the pool to the Ice Bucket.
2. On the Ice Bucket screen, set the number of derivatives to create (they are placed into the flow cell lanes) and select Begin Work.
   The Validate Inputs Flowcell Type automation checks that there is only one container input to the step.
3. On entry to the Record Details screen, the Calculate Volumes automation is triggered.
   This automation sets the following values based on the selected Flowcell Type:
   - NaOH Volume (µl)
   - Tris-HCl Volume (µl)
   - DPX1 Volume (µl)
   - DPX2 Volume (µl)
   - DPX3 Volume (µl)
   - Mastermix per Lane (µl)
   - The automation also generates the Calculation File (*csv) and attaches it to the step. This file contains information about the DPX Mastermix volume and the volume of Mastermix, NaOH, and Tris-HCl to add per working pool.
4. On the Record Details screen, the Reagent Lot Tracking section tracks the DPX1, DPX2, DPX3, NaOH, Resuspension Buffer, and Tris-HCl reagents used in the step. To add and activate reagent lots, complete the following steps:
   a. In a new browser tab, open an additional instance of Clarity LIMS.
   b. Navigate to the Consumables configuration screen.
   c. Select one of the reagent kits listed and select New Lot.
   d. Set the Status of Reagent Lot switch to Active.
   e. Enter the lot details.
   f. Select Save.
   g. Repeat this process to add and activate the remaining reagent lots.
   h. Close this browser tab and return to your original working tab. Refresh the page.
5. On the Record Details screen in the Reagent Lot Tracking section, select from the active lots displayed in each drop-down list.
   In the Step Details area, the DPX1, DPX2, and DPX3 reagent volume values are already populated. These values are set by a script and are not editable while running the step.

6. In the Sample Details table, select the pool icon to view details on the working pool composition.

> The BP Aliquot, Mastermix per lane, NaOH, and Tris-HCl volume values for each working pool are already populated. These values are set by a script and are not editable while running the step.
>
> The working pool number is appended to the bulk pool name. This feature allows you to identify which working pools are derived from the same bulk pool quickly.

7. [Optional] Select the Calculation File (CSV) in the Files area to view details on the following volumes to add per working pool:
   - DPX Mastermix
   - Mastermix
   - NaOH
   - Tris-HCl
8. Select Next Steps.
   On the Assign Next Steps screen, the next step is already set to Load to Flowcell (NovaSeq 6000 v2.3).
9. Select Finish Step.

Step 3: Run Load to Flowcell (NovaSeq 6000 v2.3)

1. On the Ice Bucket screen in the Container Options panel, select the appropriate flow cell type from the Destination Container drop-down list and select Begin Work.
2. On the Placement screen, drag the pools from the left of the screen over into the Placed Samples area on the right.
   a. Scan or type the barcode of the flow cell into the Flow Cell field.
   b. Select Record Details.
   On exit of the Placement screen, the Validate Flowcell Barcode automation validates the container barcode.

Flowcell Type	Barcode Mask
SP	[A-Z0-9]{5}DR[A-Z0-9]{2}
S1	[A-Z0-9]{5}DR[A-Z0-9]{2}
S2	[A-Z0-9]{5}DM[A-Z0-9]{2}
S4	[A-Z0-9]{5}DS[A-Z0-9]{2}

3. The fields displayed in the Step Details section are used to generate the sample sheet and run recipe files. Some of these fields are autopopulated and some must be completed manually. See the following table for details.

Table 236 Fields Displayed on Record Details Screen of Load to Flowcell (NovaSeq 6000 v2.3) Step

Field	Value
Experiment Name	Enter the experiment name. Only alphanumeric characters, dashes, and underscores are permitted. No spaces.
BaseSpace Sequence Hub Configuration	Presets • Not Used • Run Monitoring Only • Run Monitoring and Storage
Workflow	Presets • GenerateFASTQ
Workflow Type	Presets • No Index • Single Index • Dual Index
Index Read 1	Presets • 0 • 6 • 8 • type a value between 0 and 20
Index Read 2	Presets • 0 • 6 • 8 • type a value between 0 and 20
Paired End	Presets • True • False
Read 1 Cycles	Presets • 251 • 151 • 101 • 51 • type a value between 1 and 251 for the SP flow cell type or between 1 and 151 for all other types

Field	Value
Read 2 Cycles	Presets • 251 • 151 • 101 • 51 • type a value between 0 and 251 for the SP flow cell type or between 0 and 151 for all other types
Use Custom Read 1 Primer	Select if applicable.
Use Custom Read 2 Primer	Select if applicable.
Use Custom Index Read 1 Primer	Select if applicable.
Reverse Complement Workflow	Select Yes (by default) for v1.5 reagents in NovaSeq Control Software v1.7 and onwards. Select No for v1 reagents.
UMI - Read 1 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 1. Leave blank if not applicable.
UMI - Read 2 Length	Enter the length of the Unique Molecular Identifiers (UMI) in Read 2. Leave blank if not applicable.
UMI - Read 1 Start From Cycle	Enter the cycle number that Read 1 starts from. Leave blank if not applicable.
UMI - Read 2 Start From Cycle	Enter the cycle number that Read 2 starts from. Leave blank if not applicable.
Sample Sheet Path	Automatically populated after the sample sheet has been generated.
Library Tube Barcode	Scan the library tube barcode.

4. Select Generate Sample Sheet and Run Recipe. This selection triggers the automation script, which:
   - Generates and attaches the sample sheet and JSON files to the placeholders in the Files area of the Record Details screen.
   - Populates the Sample Sheet Path field with the path to the sample sheet file.
5. Select Next Steps.
   This selection triggers the Prepare Files for NovaSeq automation, which copies the sample sheet and run recipe files to the location specified during installation. The NovaSeq instrument software uses these files to set up the run.

6. On the Assign Next Steps screen, make sure the Next Step for samples is prepopulated with Mark protocol as complete.
7. Select Finish Step.

At this point in the workflow, the user interaction ends. The flow cell is queued for the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step.

Proceed to Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3).

Do not add samples to the Ice Bucket or start the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step. The integration does this action automatically.

Protocol 4: AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)

This protocol contains a single fully automated step - AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3).

The integration starts the step automatically and data from the run is parsed back into Clarity LIMS. No user interaction is required. However, you can open and review the various stages of the step in Clarity LIMS.

How the Integration Works

1. When initiating a run on the NovaSeq instrument, the NovaSeq Control Software (NVCS) looks for the sample sheet and run recipe (*.json file) on the shared network drive. The NVCS copies the sample sheet to the run directory.
   The NVCS uses the run recipe to start the sequencing run.
2. When the run starts, the instrument software creates a new run folder on the shared network drive and copies the following files into that folder:
   - `RunParameters.xml`
   - `RunInfo.xml`
   - LIMS/ <ContainerID>.json file (run recipe)
   - The Real-Time Analysis v3 (RTA3) software creates the InterOp folder.
3. The sequencing service detects the presence of the `RunParameters`, `RunInfo`, and JSON files and starts the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step in Clarity LIMS.
4. As the run progresses, the InterOp data files are filled in.
5. At the end of the run, the NovaSeq creates the `CopyComplete.txt` file in the InterOp folder, which indicates to the sequencing service that the run has completed and the data files are ready.
6. The NovaSeq copies the run data files to the InterOp folder and the sequencing service triggers the Read InterOp Metrics automation. This automation reads the files, records the parsed metrics into Clarity LIMS, and completes the step in Clarity LIMS.

For Research Use Only. Not for use in diagnostic procedures.

Parse Run Parameters and Generate Link to Run Folder Automation

The Parse Run Parameters and Generate Link to Run Folder automation is automatically triggered on entry to the Record Details screen. This automation parses the `RunParameters.xml` file attached on the Step Setup screen and populates the global/master step fields with extracted values. For details on this automation, including how the parsed fields map to the master step fields in Clarity LIMS, refer to *NovaSeq 6000 Integration v2.5 Configuration & User Interaction* on page 915.

Read InterOp Metrics Automation

Automatically triggered when the sequencing service detects the `CopyComplete.txt` file has been created, this automation parses the InterOp data generated by the run.

The `read_interop_metrics` script records summary metrics into the following global fields in Clarity LIMS. The script fails if any field is not configured or cannot be written to.

- Yield PF (Gb) R1
- Yield PF (Gb) R2
- Reads PF (M) R1
- Reads PF (M) R2
- Cluster Density (K/mm^2) R1
- Cluster Density (K/mm^2) R2
- %PF R1
- %PF R2
- % Bases >=Q30 R1
- % Bases >=Q30 R2
- Intensity Cycle 1 R1
- Intensity Cycle 1 R2
- % Phasing R1
- % Phasing R2
- % Prephasing R1
- % Prephasing R2
- % Aligned R1
- % Aligned R
- % Error Rate R1
- % Error Rate R2

For details, refer to *NovaSeq 6000 Integration v2.5 Configuration & User Interaction* on page 915.

Set Next Steps Automation

After the run metrics are parsed successfully, the Set Next Steps automation sets the next step for all samples to Mark protocol as complete. This step is completed automatically. For details, refer to *NovaSeq 6000 Integration v2.5 Configuration & User Interaction* on page 915.

Troubleshooting

If an automation trigger does not appear to run its corresponding scripts, see the following sections in the Clarity LIMS documentation:

- *Troubleshooting Automated Informatics*
- *Troubleshooting Automation in the API*

If an error occurs that does not provide direction on how to proceed, complete the following steps:

1. Confirm the version of the installed Illumina NovaSeq Integration Package by running the `rpm -qa | grep -i novaseq` command as follows.
   - For an on-premise deployment, run the command on Clarity LIMS server command line. This command retrieves the version of both RPMs installed.
   - For a cloud hosted deployment, run the command on the local server installation. This command retrieves the version of the remote extensions RPM installed.
2. If the error is related to the AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3) step, there are two places to check for log file information:
   - If the step does not start, check the `NovaSeqIntegrator.log` file written to:

```
/opt/gls/clarity/extensions/novaseq/SequencingService/NovaSeqIntegrator.log
```

     This log file is written to this path wherever the remote extensions RPM was installed.
   - If the step starts but does not complete, open the step in Clarity LIMS (it can be found via a search). On the Record Details screen, the log file is attached to a placeholder called Log File. If you are unable to reach the Record Details screen, or if the file does not contain an error, review the `NovaSeqIntegrator.log` described previously.
3. Contact Illumina Support and supply the relevant information from the troubleshooting steps already performed.

NovaSeq 6000 Integration v2.5 Installation

The Illumina NovaSeq 6000 Integration v2.5 supports the integration between Clarity LIMS and the NovaSeq 6000 instrument. This integration also provides support for Clarity LIMS v6.2 and includes updates to the technology stack and third party libraries and utilities.

Clarity LIMS is automatically stopped during installation of the RPM and will need to be restarted.

The file-based and API-based integrations cannot run at the same time. When the API-based integration has finished installing, shut down Clarity LIMS and uninstall the file-based integration.

This document provides instructions for installing NovaSeq 6000 Integration v2.5. It also describes the components that are installed in the default configuration.

Integration Overview

Illumina NovaSeq 6000 Integration v2.5 includes the following features and functionality:

- Preconfigured NovaSeq 6000 v2.3 workflow that maps to lab protocols and instrument runs.
- The following preconfigured protocols:
  - NovaSeq Standard (NovaSeq 6000 v2.3) (supports standard library placement)
  - NovaSeq Xp (NovaSeq 6000 v2.3) (supports individual lane loading on the NovaSeq 6000)
- Automated generation of the sample sheet. This sample sheet is used with the bcl2fastq2 v2.20 analysis software.
- Automated generation of the run recipe file in the JSON format. This file is automatically uploaded to the instrument and is used to set up and initiate the run.
- Automated tracking of the following information for the NovaSeq 6000 sequencing run and parsing of run statistics into Clarity LIMS:
  - Progress and metrics of sequencing run
  - Per-instrument sequencing runs (tracked as part of the Run ID field value)
  - Sequencing run parameters
  - Real-Time Analysis v3 (RTA3) version and other run-specific information
- Preconfigured NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) workflow used for validation purposes. This workflow contains a single-step protocol that models the library prep required to produce normalized libraries that are ready for the NovaSeq 6000 v2.3 workflow. For more information, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

Supporting Documentation

- For details on installed protocols and steps, automations, generated and captured files, and rules and constraints, refer to *NovaSeq 6000 Integration v2.5 Configuration & User Interaction* on page 915.
- For information on validating and troubleshooting the integration, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

Prerequisites

NovaSeq 6000 Integration v2.5 has the following prerequisites:

- Mount run data network-attached storage (NAS) share
- Secret Util is installed
- IPP is installed

Prerequisite 1: Mount Run Data NAS Share

Mounting the NAS share of run data is needed to capture and generate files associated with the sequencing run. To mount NAS shares that contain data from the Clarity LIMS server, set up the following Write privileges as the glsai user:

- Sample sheet directory—This directory is where the Prepare Files for NovaSeq script writes sample sheets.
- Run recipe directory—This directory is where the Prepare Files for NovaSeq script writes run recipe files in the JSON format.

Set up the Read privileges as the glsjboss and glsai users (or as the entire claritylims group) for the run output directory. This directory is where the sequencing service looks for run folders. The run folders must be in this directory. The service does not search sub-directories.

The sample sheet, run recipe, and run output directories can be configured independently and do not have to be on the same mount or share.

Prerequisite 2: Secret Util Installation

The Clarity LIMS installation tooling configures the Secret Util installation. No additional configuration is necessary. For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

Installation

NovaSeq 6000 Integration v2.5 supports both on-premise and cloud integrations. This integration is distributed as the following RPM packages:

- BaseSpaceLIMS-novaseq-extensions
- BaseSpaceLIMS-novaseq-sequencing-service (depends on BaseSpaceLIMS Automation Worker v1.x)

The BaseSpaceLIMS-novaseq-extensions RPM installs the following items:

- Protocols and steps
- Validation workflow
- Database properties that configure the service

- `novaseq-extensions.jar` file that provides sample sheet generation and other utility scripts

The BaseSpaceLIMS-novaseq-sequencing-service RPM installs the following items:

- Bash scripts to run the novaseq_seqservice through systemctl
- `novaseq-sequencing.jar`
- `novaseq-remote-extensions.jar` file that contains scripts that need access to the run folders on the NAS

On-Premise Installation

Use the following instructions to install the BaseSpaceLIMS-novaseq-extensions and BaseSpaceLIMS-novaseq-sequencing-service RPMs on the Clarity LIMS server.

Install the RPMs

1. On the Clarity LIMS server, log in as the root user.
2. Run the following yum commands to install the RPMs:

   > You must include the --enablerepo command line argument. Illumina Support provides the repo file and appropriate name to use.

```
yum install BaseSpaceLIMS-novaseq-extensions --enablerepo=<< repo name info from support >>
yum install BaseSpaceLIMS-novaseq-sequencing-service --enablerepo=<< repo name info from support >>
```

3. Enter `y` to confirm that you want to proceed with the RPM installations.
4. If Secret Util is not installed or configured, you must configure it before proceeding. As the glsjboss user, run the following script:

```
bash /opt/gls/clarity/config/pending/05_configure_claritylims_secretutil.sh
```

   For more information on installing Secret Util with the Integration Module, refer to *Install/Upgrade Secret Management for Integration Modules* in the *Clarity LIMS Core Functionality* documentation.

   > For the on-premise installation, the Illumina Vault server is not available for public access.
   >
   > In the configuration, make sure the system passwords are configured correctly in File mode.

5. [Optional] If you are upgrading from a previous integration, check for any usages of the Custom API Username in the current system as follows.
   a. Install ClarityLIMS-UpgradePreValidation.
   b. Check for any custom API username requirements (eg, novaseq_user).
   Typically, the default API user name is apiuser.
   c. Run the following script:

```
/opt/gls/ClarityUpgradeValidation/bin/checkUsernameConfiguration.sh
```

   d. After the script is complete, check that a custom user is configured in the results.

For Research Use Only. Not for use in diagnostic procedures.

If a custom API username is configured, a warning message displays.

e. If a custom API username is required, configure the username and password using Secret Util:

```
java -jar /opt/gls/clarity/tools/secretutil/secretutil.jar -n=INTEGRATION -
u=<password> <key>
```

For a custom API username, set the `<key>` to `apiusers/{custom API username}` (eg, `apiusers/novaseq_user`). For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

f. Use the following command to make sure that the password is saved correctly in Secret Util:

```
java -jar /opt/gls/clarity/tools/secretutil/secretutil.jar -n=INTEGRATION
<key>
```

Import Workflow Configurations for NovaSeq 6000

1. As the glsjboss user, use the following command to run the `configure_extensions_novaseq.sh` script:

```
bash /opt/gls/clarity/config/configure_extensions_novaseq.sh
```

2. When prompted, enter the channel name for the Automation Worker and sequencing service.

When upgrading from NovaSeq Integration v2.2 to v2.5, a conflict is expected during the workflow import with the Flowcell Type analyte custom field due to SP being added to the list of preset values. You can manually add `<preset>SP</preset>` as one of the values of the Flowcell Type custom field after you import the workflow.

Configure the Database Service Properties

To enable capture and generation of files associated with the sequencing run, configure the following properties using the omxProps-ConfigTool utility.

Table 237 Configurable Database Properties

Property	Description
novaseq.runSetupFolder	The directory where the Prepare Files for NovaSeq script writes run recipe files in the JSON format. This must be an existing folder and must be writable by the glsai user. For more information, refer to *Prerequisites* on page 990.

Property	Description
novaseq.sampleSheetPathPrefixSearch.SUFFIX	The directory where NVCS or analysis software looks for sample sheets. This directory is typically a Windows path or a network drive. The integration does not use this path directly, but the attachment filed in the run recipe file is determined by adding the sample sheet file name to this value.
novaseq.sampleSheetPathPrefixReplace.SUFFIX	The directory where the Prepare Files for NovaSeq script writes sample sheets. This must be an existing folder and must be writable by the glsai user. For more information, refer to *Prerequisites* on page 990.
novaseq.sampleSheetPathPrefixSearchReplaceSuffixes	This property must be set to the SUFFIX used in the novaseq.sampleSheetPathPrefixSearch.SUFFIX and novaseq.sampleSheetPathPrefixReplace.SUFFIX properties.
novaseq.seqservice.netPathPrefixSearch.SUFFIX	This property is the search prefix used to map the OutputRunFolder field in the `RunParameters.xml` file to the corresponding Linux directory. The OutputRunFolder is converted by replacing this string with the netPathPrefixReplace value. The value of this property is also in the output_folder field of the run recipe file.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
novaseq.seqservice.netPathPrefixReplace.SUFFIX	The directory where the sequencing service looks for run folders. This must be an existing folder and must be writable by the glsai or glsjboss users, or by the claritylims group. For more information, refer to *Prerequisites* on page 990. The run folders must be in the configured directory. The service does not search sub-directories.
novaseq.seqservice.netPathPrefixSearchReplaceSuffixes	This property must be set to the single SUFFIX used in novaseq.seqservice.netPathPrefixSearch.SUFFIX and novaseq.seqservice.netPathPrefixReplace.SUFFIX.

This version of the integration only supports a single active search-replace pair of each type. The sampleSheetPathPrefixSearchReplaceSuffixes and netPathPrefixSearchReplaceSuffixes properties must contain a single number instead of a comma-separated list of numbers.

The sample sheet, run recipe, and run output folders can all be configured independently and do not have to be on the same mount or share. For examples of valid configuration mount points and properties, refer to *Example Network Folder Structure and Database Properties* on page 1000.

Start the Sequencing Service

1. Run the following command to start the sequencing service:

```
systemctl start novaseq_seqservice
```

Cloud Installation

The BaseSpaceLIMS-novaseq-extensions RPM must be installed on the Clarity LIMS server. The BaseSpaceLIMS-novaseq-sequencing-service RPM can be installed remotely on another server within the network.

Specifications

The following hardware, operating system, and network specifications must be met to install the BaseSpaceLIMS-novaseq-sequencing-service RPM:

- Hardware requirements:
  - 64-bit processor (dual core 2.0 GHz)
  - OS requirements, plus at least an additional 2 GB RAM
  - A minimum of 5 GB of hard disk space

For Research Use Only. Not for use in diagnostic procedures.

- Operating system requirements:
  - Clarity LIMS v6.2 or later
  - Oracle Linux (for compatibility, refer to *NovaSeq 6000 Integration v2.5 Release Notes* on page 1002)
  - Minimum requirements for remote Automation Worker (for more information, refer to the *Clarity LIMS Core Functionality* documentation)

  > If you are running the sequencing service and Automation Worker on the same instance, make sure that the instance is running a compatible version of Oracle Linux. For compatibility, refer to *NovaSeq 6000 Integration v2.5 Release Notes* on page 1002.

- Network requirements:
  - SSL access to the Clarity LIMS server from the network
  - The mounted folder where the run recipes are written
  - The mounted folder where the sample sheets are written
  - The mounted folder where the sequencing runs are written

Install the RPM

1. On the applicable server, log in as the root user.
2. Run the following yum command to install the BaseSpaceLIMS-novaseq-extensions RPM:

   > You must include the --enablerepo command line argument. Illumina Support provides the repo file and appropriate name to use.

```
yum install BaseSpaceLIMS-novaseq-extensions --enablerepo=<< repo name info from support >>
```

3. Enter `y` to confirm that you want to proceed with the RPM installation.
4. If Secret Util is not installed or configured, you must configure it before proceeding. As the glsjboss user, run the following script:

```
bash /opt/gls/clarity/config/pending/05_configure_claritylims_secretutil.sh
```

   For more information on installing Secret Util with the Integration Module, refer to *Install/Upgrade Secret Management for Integration Modules* in the *Clarity LIMS Core Functionality* documentation.

5. [Optional] If a custom API username is required, configure the username and password as follows.
   a. Run the following command using Secret Util:

```
java -jar /opt/gls/clarity/tools/secretutil/secretutil.jar -n=INTEGRATION -u=<password> <key>
```

      For a custom API username, set the `<key>` to `apiusers/{custom API username}` (eg, `apiusers/novaseq_user`). For more information on Secret Utility configuration, refer to the *Clarity LIMS Core Functionality* documentation.

   b. Use the following command to make sure that the password is saved correctly in Secret Util:

For Research Use Only. Not for use in diagnostic procedures.

```
java -jar /opt/gls/clarity/tools/secretutil/secretutil.jar -n=INTEGRATION
<key>
```

Import Workflow Configurations for NovaSeq 6000

1. As the glsjboss user, use the following command to run the `configure_extensions_novaseq.sh` script:

```
bash /opt/gls/clarity/config/configure_extensions_novaseq.sh
```

2. When prompted, enter the channel name for the Automation Worker and sequencing service. The recommended channel name is remotens. For more information, refer to *Update Channel Name on page 996*.

When upgrading from NovaSeq Integration v2.2 to v2.5, a conflict is expected during the workflow import with the Flowcell Type analyte custom field due to SP being added to the list of preset values. You can manually add `<preset>SP</preset>` as one of the values of the Flowcell Type custom field after you import the workflow.

Update Channel Name

The configure_extensions_novaseq.sh script prompts for a channel name and sets the name on the following preconfigured automations:

- Prepare Files for NovaSeq (configured on Dilute and Denature (NovaSeq 6000 v2.3) and Load to Flowcell (NovaSeq 6000 v2.3) steps)
- Read InterOp Metrics (configured on AUTOMATED NovaSeq Run (NovaSeq 6000 v2.3) step)

If you need to change the channel name, you must update it manually on each automation. The import script does not update this setting.

Configure the Database Service Properties

To enable capture and generation of files associated with the sequencing run, configure the following properties using the omxProps-ConfigTool utility.

Table 238 Configurable Database Properties

Property	Description
novaseq.runSetupFolder	The directory where the Prepare Files for NovaSeq script writes run recipe files in the JSON format. This must be an existing folder and must be writable by the glsai user. For more information, refer to *Prerequisites on page 990*.

For Research Use Only. Not for use in diagnostic procedures.

Property	Description
novaseq.sampleSheetPathPrefixSearch.SUFFIX	The directory where NVCS or analysis software looks for sample sheets. This directory is typically a Windows path or a network drive. The integration does not use this path directly, but the attachment filed in the run recipe file is determined by adding the sample sheet file name to this value.
novaseq.sampleSheetPathPrefixReplace.SUFFIX	The directory where the Prepare Files for NovaSeq script writes sample sheets. This must be an existing folder and must be writable by the glsai user. For more information, refer to *Prerequisites* on page 990.
novaseq.sampleSheetPathPrefixSearchReplaceSuffixes	This property must be set to the SUFFIX used in the novaseq.sampleSheetPathPrefixSearch.SUFFIX and novaseq.sampleSheetPathPrefixReplace.SUFFIX properties.
novaseq.seqservice.netPathPrefixSearch.SUFFIX	This property is the search prefix used to map the OutputRunFolder field in the RunParameters.xml file to the corresponding Linux directory. The OutputRunFolder is converted by replacing this string with the netPathPrefixReplace value. The value of this property is also in the output_folder field of the run recipe file.

Property	Description
novaseq.seqservice.netPathPrefixReplace.SUFFIX	The directory where the sequencing service looks for run folders. This must be an existing folder and must be writable by the glsai or glsjboss users, or by the claritylims group. For more information, refer to *Prerequisites* on page 990. The run folders must be in the configured directory. The service does not search sub-directories.
novaseq.seqservice.netPathPrefixSearchReplaceSuffixes	This property must be set to the single SUFFIX used in novaseq.seqservice.netPathPrefixSearch.SUFFIX and novaseq.seqservice.netPathPrefixReplace.SUFFIX.

This version of the integration only supports a single active search-replace pair of each type. The sampleSheetPathPrefixSearchReplaceSuffixes and netPathPrefixSearchReplaceSuffixes properties must contain a single number instead of a comma-separated list of numbers.

The sample sheet, run recipe, and run output folders can all be configured independently and do not have to be on the same mount or share. For examples of valid configuration mount points and properties, refer to *Example Network Folder Structure and Database Properties* on page 1000.

Install Sequencing Service RPM on Remote Server

1. On the applicable server, log in as the root user.
2. Run the following yum command to install the RPM:

```
yum install BaseSpaceLIMS-novaseq-sequencing-service
```

3. Enter `y` to confirm that you want to proceed with the RPM installation.

Set Up API Connection Properties File

1. Run the following script to set up the API connection properties file at `/opt/gls/clarity/automation_worker/conf/api-access.properties`:

```
bash /opt/gls/clarity/automation_worker/node/bin/configure.sh
```

   The `configure.sh` script is provided by BaseSpaceLIMS-AutomationWorker.

Start the Sequencing Service

1. Run the following command to start the sequencing service:

```
systemctl start novaseq_seqservice
```

Workflows, Protocols, and Steps Installed

NovaSeq 6000 Integration v2.5 includes the workflows, protocols, and steps listed in the following table.

Workflow	Protocols	Steps
NovaSeq 6000 v2.3	Run Format (NovaSeq 6000 v2.3)	1. Define Run Format (NovaSeq 6000 v2.3)
	NovaSeq Standard (NovaSeq 6000 v2.3)	1. Make Bulk Pool for NovaSeq Standard (NovaSeq 6000 v2.3) 2. Dilute and Denature (NovaSeq 6000 v2.3)
	NovaSeq Xp (NovaSeq 6000 v2.3)	1. Make Bulk Pool for NovaSeq Xp (NovaSeq 6000 v2.3) 2. Dilute, Denature & ExAmp (NovaSeq 6000 v2.3) 3. Load to Flowcell (NovaSeq 6000 v2.3)
	AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)	1. AUTOMATED - NovaSeq Run (NovaSeq 6000 v2.3)
NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)	NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)	1. NovaSeq Validation Library Prep (NovaSeq 6000 v2.3)

For detailed descriptions of the steps and automations included in each protocol, and details on other components in the configuration, refer to *NovaSeq 6000 Integration v2.5 Configuration & User Interaction* on page 915.

For instructions on using the NovaSeq Validation Library Prep (NovaSeq 6000 v2.3) protocol, refer to *NovaSeq 6000 Integration v2.5 Validation and Troubleshooting* on page 972.

The configuration provided with this integration has been established to support NovaSeq 6000 lab processes. Any configuration changes to protocols or workflows, including renaming protocols, steps, and fields, could break processes.

Instrument Software

The NovaSeq instrument software includes the following components:

- NovaSeq Control Software (NVCS)—Contains the user interface for setting up the sequencing run. Responsible for controlling the instrument and acquiring the images.

- Real-Time Analysis v3 (RTA3)—Takes the images generated by the first module, processes, and analyzes them. Makes sure that data files are created and copied to the final destination folder.
- Sequencing Analysis Viewer (SAV)—Displays the important quality metrics generated by the RTA3 software.
- NovaSeq recipes—Provides system operation instructions for use with NovaSeq 6000 reagent kits for SP, S1, S2, and S4 flow cells.
- Universal Copy Service—Copies output files to destinations such as final destination folder and/or BaseSpace Sequence Hub (when the instrument is configured for use with BaseSpace Sequence Hub).

Instrument Integration Configuration

For the NovaSeq API integration to work, the NovaSeq instrument must be able to communicate with Clarity LIMS through the API. Complete the following steps to configure the NVCS and confirm that you can access Clarity LIMS from the instrument.

1. Launch NVCS and wait for the initialization process to complete.
2. On the NVCS Settings page, do the following:
   a. Under Mode Selection, select File-Based.
   b. In the adjacent field, enter the network folder location that NVCS retrieves the JSON recipe from.
   c. In the Output Folder field, enter the default output folder location.
3. Select Save to complete the configuration.
4. On the NVCS home page, you can now select Sequence to log into Clarity LIMS and start a run.

Example Network Folder Structure and Database Properties

Instrument Control Software Configuration

Refer to the following examples for the configuration of the instrument control software:

- Sample sheet directory: `\\nas\novaseq\sample_sheets`
- JSON run recipes directory: `\\nas\novaseq\run_setup`
- Output directory: `\\nas\novaseq\runs`

Linux Server Mount Points

Refer to the following examples for the Linux server mount points on either the Clarity LIMS or sequencing service server:

- Sample sheet directory: `/mnt/novaseq_sample_sheets`
- JSON run recipes directory: `/mnt/novaseq_run_setup`
- Output directory: `/mnt/novaseq_runs`

Clarity LIMS Configuration Properties

Refer to the following examples for the Clarity LIMS configuration properties:

- `novaseq.runSetupFolder`: `/mnt/novaseq_run_setup`
- `novaseq.sampleSheetPathPrefixSearchReplaceSuffixes`: 1
